3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?, size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs  Linear Feet: Width (ft): TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: ____________
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: Width (Ft).
       - Other non-wetland waters: Acres: ____________

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       Length (Linear Feet): Width (feet): Acres: ____________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: ____________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: ____________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C..

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): __________________ Acres: __________________

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters __________________

Explain finding of no Significant Nexus: See Section III.C.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: __________________ width (ft): __________________
☐ Other Non-wetland Waters MBR acres: __________________
☐ Wetlands MBR acres: __________________

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☒ Non-wetland waters 558.84 linear feet (ft), 6.08 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 266

State: AZ  County/Parish/borough: Pinal County  City: N/A

Center coordinates of site:  
Lat. 32.8482°N  Long. -111.2599°W

Name of nearest waterbody:  
Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request  
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:  
☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☐ TNWs (new)  
      ☐ Wetlands adjacent to TNWs  
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
      ☐ Non-RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
      ☐ Impoundments of jurisdictional waters  
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters:  Linear Feet  Width (ft) and/or Acres  
      Wetlands Acres:  

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☐ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1; only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1; otherwise, see Section III.B below.

1. TNW
   Identify TNW: 
   □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a TNW

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.18038
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

       (a) Relationship with TNW

       □ Tributary flows directly to TNW
       ✓ Tributary flows through 4 tributaries before entering TNW

       Project waters are 30 (or more) river miles from TNW
Project waters are [ ] river Miles from tributary to RPW:
Project waters are [ ] 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are [ ] aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics
Tributary is: Natural  Explain:

Tributary properties with respect to top of bank (estimate):
Average Width (ft):
Average Depth (ft):
Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- [ ] Silts
- [ ] Sands
- [ ] Concrete
- [ ] Muck
- [ ] Gravel
- [ ] Substrate - Vegetation
Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.
Presence of Run/Riffle/Pool Complexes. Explain: Not present.
Tributary Geometry: Relatively Straight
Tributary Gradient (approximate average slope): 1%

(c) Flow:
Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5
Describe Flow Regime: Ephemeral.
Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:
Subsurface Flow: No Explain:

Dye (or other) test performed:

Tributary Has (Check all that apply):
- [ ] Bed and Banks
- [ ] OHWM (check all the apply): OHWM Indicators:
  - [ ] Clear, natural line impressed on the bank
  - [ ] Changes in soil character
  - [ ] Shelving
  - [ ] Vegetation matted down, bent or absent
  - [ ] Leaf litter disturbed or washed away
  - [ ] Sediment deposition
  - [ ] Water staining
Other (list):

- [ ] Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: [ ]
- Oil or scum line along shore objects [ ]
- Fine shell or debris deposits (foreshore) [ ]
- Physical markings/characteristics [ ]
- Tidal gauges [ ]
- Other [ ]

- Mean High water Mark indicated by: [ ]
- Survey to available datum [ ]
- Physical markings [ ]
- Vegetation lines/changes in vegetation types [ ]

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain:

Identify Specific Pollutants, if known:

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: [ ]
- Wetland Fringe Characteristics: [ ]

Habitat for:

- Federally Listed Species Explain findings:
- Fish/Spawn Areas Explain findings:
- Other environmentally-sensitive species Explain findings:
- Aquatic/Wildlife diversity Explain:

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

Wetland Size (ac): [ ]
Wetland Type, Explain: [ ]
Wetland Quality, Explain: [ ]

Project Wetlands Cross or Serve as State Boundaries, Explain:

(b) General Flow Relationship with Non-TNW:

Surface Flow is: [ ]

Characteristics: [ ]

Subsurface Flow: [ ]

Explain Findings: [ ]

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW [ ]
- Wetland Not Directly Abutting Non-TNW [ ]

Discrete wetland hydrologic connection Explain: [ ]
Ecological connection Explain: [ ]
Separated by berm/barrier Explain: [ ]

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: [ ]
Project Wetlands: Aerial Miles from TNW: [ ]

Flow is From: [ ]

Estimate approximate Location of Wetland within Floodplain: [ ]
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: etc.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

☐ Riparian Buffer Characteristics (type, average width):

☐ Vegetation type/percent cover. Explain:

Habitat for:

☐ Federally Listed Species Explain:

☐ Fish/Spawn Areas Explain:

☐ Other environmentally-sensitive species Explain:

☐ Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below:

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands.  
   Check all that apply and provide size estimates in review area:
   - TNWs  
     Linear Feet: Width (ft): TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     Provide estimates for jurisdictional waters in the review area (check all that apply):
     - Tributary waters Linear Feet: Width (Ft).
     - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   
   Provide estimates of jurisdictional waters within the review area (check all that apply):
   Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW
     
   Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
   
   Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C..

Provide estimates for jurisdictional wetland in the review area (in acres):

### 7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

| E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE |
| Supporting rationale: |
| Length (linear feet): | Acres: |

### F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters linear feet (ft), width (ft):

### SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 267

State: Arizona  
County/Parish/borough: Pinal County  
City: N/A

Center coordinates of site:  
Lat. 32.8482°N  
Long. -111.2599°W

Name of nearest waterbody:

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  
Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:  
☐ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):

☐ TNWs (new)  
☐ Wetlands adjacent to TNWs  
☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
☐ Non-RPWs that flow directly or indirectly into TNWs  
☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
☐ Impoundments of jurisdictional waters  
☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

Non-Wetlands waters Linear Feet Width (ft) and/or Acres  

Wetlands Acres:

c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:  

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: _______________________________ ☐ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a TNW:

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
   Watershed Size (sq mi): _______________________________ 49650
   Drainage Area (sq mi): _______________________________ 1.35312
   Average Annual Rainfall (in): _______________________________ 10
   Average Annual Snowfall (in): _______________________________ 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW
   ☐ Tributary flows directly to TNW
   ☑ Tributary flows through ______ tributaries before entering TNW
   Project waters are ______ river miles from TNW

   (b) Physical Characteristics:
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
Average Width (ft):
Average Depth (ft):
Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Cobble
- Gravel
- Substrate - Vegetation
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pour Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:
Subsurface Flow: No Explain:

Dye (or other) test performed:

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
- Clear, natural line impressed on the bank
- Changes in soil character
- Shelving
- Vegetation matted down, bent or absent
- Leaf litter disturbed or washed away
- Sediment deposition
- Water staining

Presence of litter and debris
Destruction of terrestrial vegetation
Presence of wrack line
Sediment sorting
Scour
Multiple observed or predicted flow events
Abrupt change in plant community

Other (list):

Discontinuous? Explain:

(b) General Flow Relationship with Non-TNW:
- Wetland Flow is:  Explain: 
- Surface Flow is: 
- Characteristics: 
- Subsurface Flow:  Explain Findings:

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW 
- Wetland Not Directly Abutting Non-TNW
- Discrete wetland hydrologic connection  Explain: 
- Ecological connection  Explain: 
- Separated by berm/barrier  Explain:

(d) Proximity (Relationship) to TNW
- Project Wetlands: River Miles from TNW: 
- Project Wetlands: Aerial Miles from TNW: 
- Flow is From: 
- Estimate approximate Location of Wetland within Floodplain: 
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

**Note:** Does any TNW.

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- [ ] Riparian Buffer Characteristics (type, average width):
- [ ] Vegetation type/percent cover. Explain:
  
  *Habitat for:*
  - [ ] Federally Listed Species Explain:
  - [ ] Fish/Spawn Areas Explain:
  - [ ] Other environmentally-sensitive species Explain:
  - [ ] Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?, size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

**Note:** the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- [ ] TNWs  Linear Feet: [ ] Width (ft): [ ] TNW Acres [ ]
- [ ] Wetlands adjacent to TNWs: [ ] Acres: [ ]

2. RPWs that flow directly or indirectly into TNWs

- [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: [ ]

- [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

  - Provide estimates for jurisdictional waters in the review area (check all that apply):
    - [ ] Tributary waters  Linear Feet: [ ] Width (Ft).
    - [ ] Other non-wetland waters: [ ] Acres: [ ]

3. Non-RPWs that flow directly or indirectly into TNWs.

- [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

  Provide estimates of jurisdictional waters within the review area (check all that apply):

  - Length (Linear Feet): [ ] Width (feet): [ ] Acres: [ ]

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

  - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

  - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW

  Provide acreage estimates for jurisdictional wetland in the review area: [ ] Acres: [ ]

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

  Provide acreage estimates for jurisdictional wetland in the review area: [ ] Acres: [ ]

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters linear feet (ft), width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      - Non-Wetlands waters (Linear Feet) Width (ft) and/or Acres
      - Wetlands Acres:  

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain:  Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   
   Identify TNW:  
   
   □ Vegetation
   
   Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) **General Area Conditions:**
   
<table>

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.
Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- **TNWs**
  - Linear Feet: __________
  - Width (ft): __________
  - TNW Acres: __________

- **Wetlands adjacent to TNWs**
  - Acres: __________

2. RPWs that flow directly or indirectly into TNWs

- **Tributaries of TNWs where tributaries typically flow year-round are jurisdictional.** Provide data and Rationale indicating that tributary is perennial: __________

- **Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional.** Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: __________
  - Provide estimates for jurisdictional waters in the review area (check all that apply):
    - Tributary waters
      - Linear Feet: __________
      - Width (Ft): __________
    - Other non-wetland waters
      - Acres: __________

3. Non-RPWs that flow directly or indirectly into TNWs.

- **Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional.** Data supporting this conclusion provided at section III.C.
  - Provide estimates of jurisdictional waters within the review area (check all that apply):
    - Length (Linear Feet): __________
    - Width (feet): __________
    - Acres: __________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- **Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.**
  - **Wetlands directly abutting an RPW where tributaries typically flow year-round.** Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: __________
  - **Wetlands directly abutting an RPW where tributaries typically flow "Seasonally".** Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: __________
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- **Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional.** Data supporting this conclusion is provided at Section III.C.
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet : width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters linear feet , width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

  Additional Comments to Support JD:
SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 269  
State: AZ  
County/Parish/borough: Pinal County  
City: N/A

Section coordinates of site:  
Lat. 32.8482°N  
Long. -111.2599°W

Name of nearest waterbody:  
Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request  
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)  
☐ Office (Desk) Determination. Date:  
☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION  
There are no "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION  
There are no "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.  
   a. Indicate presence of water of U.S. in review area (Check all the apply):  
      ☐ TNWs (new)  
      ☐ Wetlands adjacent to TNWs  
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
      ☐ Non-RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
      ☐ Impoundments of jurisdictional waters  
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area  
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres  
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:  

2. Non-Regulated Waters/Wetlands (check if applicable):  
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:  
   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW: ___________________________ ☐ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.02501
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   ☐ Tributary flows directly to TNW
   ☑ Tributary flows through 4 tributaries before entering TNW

   Project waters are 30 (or more) river miles from TNW
**APPROVED JURISDICTIONAL DETERMINATION FORM**  
**U.S Army Corps of Engineers**

| Feature ID: 269 |

**Project waters are** river Miles from tributary to RPW:  
**30 (or more)** aerial (straight) miles from tributary to TNW:  
**Project waters are** aerial (straight) miles from tributary to RPW:  
**Project waters cross or serve as state boundaries.** Explain:  

**Identify flow route to TNW**  
Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

### (b) General Tributary Characteristics

**Tributary is:** Natural  
**Explain:**

**Tributary properties with respect to top of bank (estimate):**

<table>
<thead>
<tr>
<th>Average Width (ft):</th>
</tr>
</thead>
<tbody>
<tr>
<td>Average Depth (ft):</td>
</tr>
<tr>
<td>Average Side Slopes:</td>
</tr>
</tbody>
</table>

**Primary tributary substrate composition (check all that apply):**

- [ ] Silts  
- [ ] Sands  
- [ ] Concrete  
- [ ] Muck  
- [x] Gravel  
- [ ] Substrate - Vegetation  
**Other, Explain:**

**Tributary Condition/Stability** [e.g., highly eroding, sloughing banks. Explain:]

- Stable.

**Presence of Run/Riffle/Pool Complexes. Explain:** Not present.

**Tributary Geometry:**

- Relatively Straight

**Tributary Gradient (approximate average slope):**

- 1%

### (c) Flow:

**Tributary Provides for:** Ephemeral Flow

**Estimate average number of flow events in review area/year:**

- 2-5

**Describe Flow Regime:** Ephemeral.

**Surface Flow is:** Discrete and Confined  
**Characteristics:**

**Subsurface Flow:** No  
**Explain:**

- [ ] Dye (or other) test performed:  

**Tributary Has (Check all that apply):**

- [ ] Bed and Banks  
- [x] OHWM (check all the apply): OHWM Indicators:
  - [ ] Clear, natural line impressed on the bank  
  - [x] Changes in soil character  
  - [ ] Shelving  
  - [ ] Vegetation matted down, bent or absent  
  - [ ] Leaf litter disturbed or washed away  
  - [ ] Sediment deposition  
  - [ ] Water staining  
  - [x] Presence of litter and debris  
  - [ ] Destruction of terrestrial vegetation  
  - [ ] Presence of wrack line  
  - [ ] Sediment sorting  
  - [ ] Scour  
  - [x] Multiple observed or predicted flow events  
  - [ ] Abrupt change in plant community  
**Other (list):**

- [ ] Discontinuous?  
**Explain:**
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: ________________________________
- Mean High water Mark indicated by: ________________________________
- oil or scum line along shore objects
- fine shell or debris deposits (foreshore)
- physical markings/characteristics
- tidal gauges
- other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: __________________________________________

Identify Specific Pollutants, if known: ________________________________

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: ________________________________
- Wetland Fringe Characteristics: ________________________________

Habitat for:

- Federally Listed Species Explain findings: ________________________________
- Fish/Spawn Areas Explain findings: ________________________________
- Other environmentally -sensitive species Explain findings: ________________________________
- Aquatic/Wildlife diversity Explain: ________________________________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac): ________________________________
- Wetland Type, Explain: ________________________________
- Wetland Quality, Explain: ________________________________

Project Wetlands Cross or Serve as State Boundaries, Explain: ________________________________

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: ________________________________ Explain: ________________________________

Surface Flow is: ________________________________

Characteristics: ________________________________

Subsurface Flow: ________________________________ Explain Findings: ________________________________

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW
  - Discrete wetland hydrologic connection Explain: ________________________________
  - Ecological connection Explain: ________________________________
  - Separated by berm/barrier Explain: ________________________________

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: ________________________________

Project Wetlands: Aerial Miles from TNW: ________________________________

Flow is From: ________________________________

Estimate approximate Location of Wetland within Floodplain: ________________________________
(ii) Chemical Characteristics:
Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.)

Explain
Identify specific pollutants, if known:

(iii) Biological Characteristics. Wetland supports (check all that apply):
- Riparian Buffer Characteristics (type, average width):
- Vegetation type/percent cover. Explain:
  Habitat for:
  - Federally Listed Species Explain:
  - Fish/Spawn Areas Explain:
  - Other environmentally-sensitive species Explain:
  - Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)
   All wetland(s) being considered in cumulative analysis:
   Wetland acres in total being considered in cumulative analysis:
   Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION
A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g., between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below:

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

<table>

3. Non-RPWs that flow directly or indirectly into TNWs.

|   | Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C. |
|   | Provide estimates of jurisdictional waters within the review area (check all that apply): |
|   | Length (Linear Feet): Width (feet): Acres: |

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

|   | Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands. |
|   | Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: |
|   | Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: |
|   | Provide acreage estimates for jurisdictional wetland in the review area: Acres: |

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

|   | Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C. |
|   | Provide acreage estimates for jurisdictional wetland in the review area: Acres: |

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet):   Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams):  linear feet:   width (ft):
☐ Other Non-wetland Waters MBR acres:
☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters linear feet (ft),  width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

- **Waters subject to the ebb and flow of the tide:** No
- **Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce:** No

B. **CWA SECTION 404 DETERMINATION OF JURISDICTION**

There **Are No** "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. **Waters of the U.S.**
   a. **Indicate presence of water of U.S. in review area (Check all the apply):**
      - [ ] TNWs (new)
      - [ ] Wetlands adjacent to TNWs
      - [ ] Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      - [ ] Non-RPWs that flow directly or indirectly into TNWs
      - [ ] Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      - [ ] Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      - [ ] Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      - [ ] Impoundments of jurisdictional waters
      - [ ] Isolated (interstate or intrastate) waters, including isolated wetlands

   b. **Identify (estimate) size of waters of the U.S. in the review area**
      - Non-Wetlands waters: Linear Feet Width (ft) and/or Acres
      - Wetlands Acres: 

   c. **Limits (boundaries) of Jurisdiction based on:**

2. **Non-Regulated Waters/Wetlands (check if applicable):**

   - **Check potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:** Yes

   - **Explain:** Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ___________________________ □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.02306
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         ☑ Tributary flows through 4 tributaries before entering TNW
         □ Tributary flows directly to TNW
         Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:
Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics
Tributary is: Natural Explain:
Tributary properties with respect to top of bank (estimate):
Average Width (ft):
Average Depth (ft):
Average Side Slopes: 3:1
Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Gravel
- Substrate - Vegetation
Other, Explain:
Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.
Presence of Run/Riffle/Pool Complexes. Explain: Not present.
Tributary Geometry: Relatively Straight
Tributary Gradient (approximate average slope): 1%

(c) Flow:
Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5
Describe Flow Regime: Ephemeral.
Other Information on Duration and Volume:
Surface Flow is: Discrete and Confined Characteristics:
Subsurface Flow: No Explain:
- Dye (or other) test performed:

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community
Other (list):
- Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: [ ]
- Oil or scum line along shore objects: [ ]
- Fine shell or debris deposits (foreshore): [ ]
- Physical markings/characteristics: [ ]
- Tidal gauges: [ ]
- Other: [ ]
- Mean high water mark indicated by: [ ]
- Survey to available datum: [ ]
- Physical markings: [ ]
- Vegetation lines/changes in vegetation types: [ ]

(iii) Chemical Characteristics:

Characterize tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

- Explain: [ ]
- Identify specific pollutants, if known: [ ]

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian corridor characteristics: [ ]
- Wetland fringe characteristics: [ ]

Habitat for:

- Federally listed species: [ ]
- Fish/spawn areas: [ ]
- Other environmentally-sensitive species: [ ]
- Aquatic/wildlife diversity: [ ]

Explain findings:

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland size (ac): [ ]
- Wetland type, explain: [ ]
- Wetland quality, explain: [ ]

Project wetlands cross or serve as state boundaries, explain: [ ]

(b) General Flow Relationship with Non-TNW:

- Wetland flow is: [ ]
- Explain: [ ]
- Surface flow is: [ ]
- Characteristics: [ ]
- Subsurface flow: [ ]
- Explain findings: [ ]

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland directly abutting non-TNW: [ ]
- Wetland not directly abutting non-TNW: [ ]
- Discrete wetland hydrologic connection: [ ]
- Ecological connection: [ ]
- Separated by berm/barrier: [ ]

Explain: [ ]

(d) Proximity (Relationship) to TNW:

- Project wetlands: river miles from TNW: [ ]
- Project wetlands: aerial miles from TNW: [ ]
- Flow is from: [ ]
- Estimate approximate location of wetland within floodplain: [ ]
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- [ ] Riparian Buffer Characteristics (type, average width):
- [ ] Vegetation type/percent cover. Explain:

Habitat for:
- [ ] Federally Listed Species Explain:
- [ ] Fish/Spawn Areas Explain:
- [ ] Other environmentally-sensitive species Explain:
- [ ] Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs Linear Feet: ______ Width (ft): ______ TNW Acres ______
   - Wetlands adjacent to TNWs: Acres: ______

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: ______ Width (Ft): ______ Acres: ______
       - Other non-wetland waters: Acres: ______

3. Non-RPWS that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     Length (Linear Feet): ______ Width (feet): ______ Acres: ______

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
       - Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Feature ID: 27

Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C..

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): _______ Acres: _______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section III.C.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- [ ] Non wetland-Waters (i.e., rivers, streams): linear feet: _______ width (ft): _______
- [ ] Other Non-wetland Waters MBR acres: _______
- [ ] Wetlands MBR acres: _______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- [ ] Non-wetland waters 298.53 linear feet (ft), 10.02 width (ft)
- [ ] Other waters acres
- [ ] Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

- [ ] Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 270

State: AZ  
County/Parish/borough: Pinal County  
City: N/A

Center coordinates of site: Lat. 32.8482°N  
Long. -111.2599°W

Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: 
Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date: 
☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters ___________________ Linear Feet ___________________ Width (ft) and/or ___________________ Acres

      Wetlands Acres: ___________________

   c. Limits (boundaries) of Jurisdiction based on:

      2. Non-Regulated Waters/Wetlands (check if applicable):

          ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

          Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________________  ☐ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.05044
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW
      ☐ Tributary flows directly to TNW
      ☑ Tributary flows through 4 tributaries before entering TNW
      Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:  
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:  
Project waters are aerial (straight) miles from tributary to RPW:  
Project waters cross or serve as state boundaries. Explain:  

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:  
Tributary properties with respect to top of bank (estimate):

- Average Width (ft):  
- Average Depth (ft):  
- Average Side Slopes: 3:1  

Primary tributary substrate composition (check all that apply):

- Silts  
- Sands  
- Concrete  
- Muck  
- Cobbles  
- gravel  
- Substrate - Vegetation  
- Other, Explain:  

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.  
Presence of Run/Riffle/Pool Complexes. Explain: Not present.  
Tributary Geometry: Relatively Straight  
Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow  
Estimate average number of flow events in review area/year: 2-5  
Describe Flow Regime: Ephemeral.

- Fish/Spawn Areas Explain:
- Other environmentally-sensitive species Explain:
- Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)
All wetland(s) being considered in cumulative analysis: 
Wetland acres in total being considered in cumulative analysis: 
Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.
Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

**D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)**

- Office (Desk) Determination. Date:
- Field Determination. Date(s): 10/2012

**SECTION II: SUMMARY OF FINDINGS**

**A. RHA SECTION 10 DETERMINATION OF JURISDICTION**

There Are No "navigable waters of the U.S."

- Waters subject to the ebb and flow of the tide.
- Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

**B. CWA SECTION 404 DETERMINATION OF JURISDICTION**

There Are No "waters of the U.S."

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

   - TNWs (new)
   - Wetlands adjacent to TNWs
   - Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
   - Non-RPWs that flow directly or indirectly into TNWs
   - Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
   - Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
   - Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
   - Impoundments of jurisdictional waters
   - Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

<table>
<thead>
<tr>
<th>Non-Wetlands waters</th>
<th>Linear Feet</th>
<th>Width (ft) and/or</th>
<th>Acres</th>
</tr>
</thead>
</table>

   Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

   - Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________________  □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.20208
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
   (a) Relationship with TNW
   □ Tributary flows directly to TNW
   ✓ Tributary flows through ____________ tributaries before entering TNW
   Project waters are _______ (or more) river miles from TNW
APPROVED JURISDICTIONAL DETERMINATION FORM
U.S Army Corps of Engineers

Feature ID: 271

Project waters are _______ river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are _______ aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain: 

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain: 

Tributary properties with respect to top of bank (estimate):
  Average Width (ft):
  Average Depth (ft):
  Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):

- [ ] Silts
- [ ] Sands
- [ ] Concrete
- [ ] Muck
- [ ] Cobbles
- [ ] Gravel
- [ ] Substrate - Vegetation

Other, Explain: 

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: 

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics: 

Subsurface Flow: No Explain: 

[ ] Dye (or other) test performed:

Tributary Has (Check all that apply):

[ ] Bed and Banks
[ ] OHWM (check all the apply): OHWM Indicators:
- [ ] Clear, natural line impressed on the bank
- [ ] Changes in soil character
- [ ] Shelving
- [ ] Vegetation matted down, bent or absent
- [ ] Leaf litter disturbed or washed away
- [ ] Sediment deposition
- [ ] Water staining

Other (list): 

[ ] Discontinuous? Explain: 

Other Information on Duration and Volume:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: ___________________________
- Mean High water Mark indicated by: ____________________
- Oil or scum line along shore objects: ____________________
- Fine shell or debris deposits (foreshore): ________________
- Physical markings or characteristics: ____________________
- Tidal gauges: ________________________________________
- Other: _____________________________________________

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: ____________________________________________

Identify Specific Pollutants, if known: ______________________

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: _______________________
- Wetland Fringe Characteristics: _________________________

Habitat for:

- Federally Listed Species Explain findings: _______________
- Fish/Spawn Areas Explain findings: ______________________
- Other environmentally-sensitive species Explain findings: __________
- Aquatic/Wildlife diversity Explain: ________________________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

- Properties:
  - Wetland Size (ac): ______________________
  - Wetland Type, Explain: ______________________
  - Wetland Quality, Explain: ______________________

- Project Wetlands Cross or Serve as State Boundaries, Explain: ______________________

(b) General Flow Relationship with Non-TNW:

- Wetland Flow is: ______________________
- Surface Flow is: ______________________

- Characteristics: ______________________
- Subsurface Flow: ______________________

- Explain Findings: ______________________

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW

- Discrete wetland hydrologic connection Explain: ______________________
- Ecological connection Explain: ______________________
- Separated by berm/barrier Explain: ______________________

(d) Proximity (Relationship) to TNW

- Project Wetlands: River Miles from TNW: ______________________
- Project Wetlands: Aerial Miles from TNW: ______________________

- Flow is From: ______________________

- Estimate approximate Location of Wetland within Floodplain: ______________________
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer  Characteristics (type, average width):
- Vegetation   type/percent cover. Explain:

Habitat for:

- Federally Listed Species  Explain:
- Fish/Spawn Areas  Explain:
- Other environmentally-sensitive species  Explain:
- Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

☐ TNWs Linear Feet: Width (ft): TNW Acres

☐ Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs

☐ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: 

☐ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: 

Provide estimates for jurisdictional waters in the review area (check all that apply):

☐ Tributary waters Linear Feet: Width (Ft).

☐ Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

☐ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

Provide estimates of jurisdictional waters within the review area (check all that apply):

Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

☐ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

☐ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

☐ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:

Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

☐ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters linear feet (ft), width (ft):
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 272

State: AZ  
County/Parish/borough: Pinal County  
City: N/A

Center coordinates of site: Lat. 32.8482°N, Long. -111.2599°W

Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  
Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:  
☐ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):

☐ TNWs (new)
☐ Wetlands adjacent to TNWs
☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
☐ Non-RPWs that flow directly or indirectly into TNWs
☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
☐ Impoundments of jurisdictional waters
☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

Non-Wetlands waters ___________ Linear Feet ___________ Width (ft) and/or ___________ Acres

Wetlands Acres: ___________

c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: __________________________
   - ☐ Vegetation

   Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary, that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   
   (i) **General Area Conditions:**
   
   | Watershed Size (sq mi): | 49650 |
   | Drainage Area (sq mi):  | 0.03530 |
   | Average Annual Rainfall (in): | 10 |
   | Average Annual Snowfall (in): | 0 |

   (ii) **Physical Characteristics:**

   (a) **Relationship with TNW**
   - ☐ Tributary flows directly to TNW
   - ☑ Tributary flows through __4__ tributaries before entering TNW
   - Project waters are __30 (or more)__ river miles from TNW
Feature ID: 272

U.S. Army Corps of Engineers

Project waters are river Miles from tributary to RPW:

Project waters are aerial (straight) miles from tributary to TNW:

Project waters are aerial (straight) miles from tributary to RPW:

Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):

Average Width (ft):

Average Depth (ft):

Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):

- Silts
- Sands
- Concrete
- Muck
- Cobble
- Bedrock
- Substrate - Vegetation

Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:

Subsurface Flow: No Explain:

Dye (or other) test performed:

Tributary Has (Check all that apply):

- Bed and Banks

- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining

  Other (list):

- Discontinuous? Explain:

  Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by:
- Mean High water Mark indicated by:
- Oil or scum line along shore objects
- Fine shell or debris deposits (foreshore)
- Physical markings/characteristics
- Tidal gauges

- Riparian Buffer Characteristics (type, average width): 
- Vegetation type/percent cover. Explain: 

Habitat for:

- Federally Listed Species Explain:
- Fish/Spawn Areas Explain:
- Other environmentally-sensitive species Explain: 
- Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis: 

Wetland acres in total being considered in cumulative analysis: 

Describe each wetland (directly abuts tributary?, size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

☐ TNWs Linear Feet: __________ Width (ft): __________ TNW Acres __________

☐ Wetlands adjacent to TNWs: Acres: __________

2. RPWs that flow directly or indirectly into TNWs

☐ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: __________

☐ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: __________

Provide estimates for jurisdictional waters in the review area (check all that apply):

☐ Tributary waters Linear Feet: __________ Width (ft): __________ Acres: __________

☐ Other non-wetland waters: Acres: __________

3. Non-RPWs that flow directly or indirectly into TNWs.

☐ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.

Provide estimates of jurisdictional waters within the review area (check all that apply):

Length (Linear Feet): __________ Width (feet): __________ Acres: __________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

☐ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

☐ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: __________

☐ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: __________

Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

☐ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.

...
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): __________ Acres: __________

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): ______ linear feet: ______ width (ft): ______
☐ Other Non-wetland Waters MBR ______ acres: ______
☐ Wetlands MBR ______ acres: ______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters ______ linear feet (ft), ______ 4.16 width (ft)
☐ Other waters ______ acres
☐ Wetlands ______ acres

SECTON IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☐ Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.
☐ Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant
  ☐ Office Concurs with data sheets/delineation report
  ☐ Office Does Not Concur with data sheets/delineation report

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION  
There Are No "Navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.
☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION  
There Are No "Waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands
   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:
   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

   Identify TNW: ____________________________    ☐ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.01256
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

      (a) Relationship with TNW

         ☐ Tributary flows directly to TNW
         ☑ Tributary flows through _______ tributaries before entering TNW

         Project waters are _______ river miles from TNW

         30 (or more)
(b) General Tributary Characteristics

Tributary is: Natural  
Explain: 

Tributary properties with respect to top of bank (estimate):
- Average Width (ft): 
- Average Depth (ft): 
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):

- [ ] Vegetation  type/percent cover. Explain:

Habitat for:
- [ ] Federally Listed Species  Explain:
- [ ] Fish/Spawn Areas  Explain:
- [ ] Other environmentally-sensitive species  Explain:
- [ ] Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all of its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

☐ TNWs Linear Feet: ___________ Width (ft): ___________ TNW Acres ___________

☐ Wetlands adjacent to TNWs: Acres: _______

2. RPWs that flow directly or indirectly into TNWs

☐ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: _____________________________.

☐ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: _____________________________.

Provide estimates for jurisdictional waters in the review area (check all that apply):

☐ Tributary waters Linear Feet: _______ Width (Ft): _______

☐ Other non-wetland waters: Acres: _______

3. Non-RPWs that flow directly or indirectly into TNWs.

☐ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

Provide estimates of jurisdictional waters within the review area (check all that apply):

Length (Linear Feet): ___________ Width (feet): ___________ Acres: _______

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

☐ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

☐ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: _____________________________.

☐ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: _____________________________.

Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

☐ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): [ ] Acres: [ ]

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- [ ] Non wetland-Waters (i.e., rivers, streams): linear feet: [ ] width (ft): [ ]
- [ ] Other Non-wetland Waters MBR acres: [ ]
- [ ] Wetlands MBR acres: [ ]

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- [x] Non-wetland waters 1384.01 linear feet (ft), 4.28 width (ft)
- [ ] Other waters acres
- [ ] Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

**A. RHA SECTION 10 DETERMINATION OF JURISDICTION**

There **Are No** "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

**B. CWA SECTION 404 DETERMINATION OF JURISDICTION**

There **Are No** "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

   ☐ TNWs (new)
   ☐ Wetlands adjacent to TNWs
   ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
   ☐ Non-RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
   ☐ Impoundments of jurisdictional waters
   ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW: ____________________________ ☐ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

(i) General Area Conditions:

(ii) Physical Characteristics:

(a) Relationship with TNW

☐ Tributary flows directly to TNW

✓ Tributary flows through 4 tributaries before entering TNW

Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:
30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics
Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
Average Width (ft):
Average Depth (ft):
Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Cobble
- Gravel
- Substrate - Vegetation
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.
Presence of Run/Riffle/Pool Complexes. Explain: Not present.
Tributary Geometry: Relatively Straight
Tributary Gradient (approximate average slope): 1%

(c) Flow:
Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5
Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:
Subsurface Flow: No Explain:

Dye (or other) test performed:

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining

  Other (list):

- Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: __________________________

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer Characteristics (type, average width):
- Vegetation type/percent cover. Explain:
- Habitat for:
  - Federally Listed Species Explain:
  - Fish/Spawn Areas Explain:
  - Other environmentally-sensitive species Explain:
  - Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs Linear Feet: Width (ft): TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: Width (Ft).
       - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
       - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale: __________________________

Length (linear feet): ______ Acres: ______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters: __________________________

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non-wetland-Waters (i.e., rivers, streams): linear feet: ______ width (ft): ______
☐ Other Non-wetland Waters MBR: acres: ______
☐ Wetlands MBR: acres: ______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters: 2020.96 linear feet (ft), 5.35 width (ft)
☐ Other waters: acres
☐ Wetlands: acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION  
There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329 in the review area.

☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION  
There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)  
      ☐ Wetlands adjacent to TNWs  
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
      ☐ Non-RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
      ☐ Impoundments of jurisdictional waters  
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ✓ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW:  
   ☐ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.03333
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         ☐ Tributary flows directly to TNW
         ☑ Tributary flows through 4 tributaries before entering TNW
      Project waters are 30 (or more) river miles from TNW
### Project waters are

**river Miles from tributary to RPW:**

**Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:**

**Project waters are aerial (straight) miles from tributary to RPW:**

**Project waters cross or serve as state boundaries. Explain:**

Identify flow route to TNW

Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

### (b) General Tributary Characteristics

3. Characteristics of all wetlands adjacent to the tributary (if any)
All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION
A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.
Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.
Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

☐ TNWs  Linear Feet:    Width (ft):   TNW Acres

☐ Wetlands adjacent to TNWs:  Acres:

2. RPWs that flow directly or indirectly into TNWs

☐ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

☐ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

   Provide estimates for jurisdictional waters in the review area (check all that apply):
   ☐ Tributary waters  Linear Feet:    Width (Ft).
   ☐ Other non-wetland waters:   Acres:

3. Non-RPWS that flow directly or indirectly into TNWs.

☐ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

Provide estimates of jurisdictional waters within the review area (check all that apply):

Length (Linear Feet):  Width (feet):  Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

☐ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
   ☐ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

   ☐ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW

   Provide acreage estimates for jurisdictional wetland in the review area:  Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

☐ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetland in the review area:  Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet : width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters 1963.60 linear feet (ft), 5.27 width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

Additional Comments to Support JD:
APPRISED JURISDICTIONAL DETERMINATION FORM
U.S Army Corps of Engineers

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD) July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 276

State: AZ
County/Parish/borough: Pinal County
City: N/A

Center coordinates of site: Lat. 32.8482°N Long. -111.2599°W

Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:
☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There ☐ Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There ☐ Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW: □ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

(i) General Area Conditions:

| Watershed Size (sq mi): | 49650 |
| Drainage Area (sq mi): | 0.02896 |
| Average Annual Rainfall (in): | 10 |
| Average Annual Snowfall (in): | 0 |

(ii) Physical Characteristics:

(a) Relationship with TNW

□ Tributary flows directly to TNW
☑ Tributary flows through 4 tributaries before entering TNW

Project waters are 30 (or more) river miles from TNW
(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- ☑ Silts
- ☑ Gravel
- ☑ Substrate - Vegetation
- ☐ Sands
- ☐ Concrete
- ☐ Muck
- ☐ Bedrock
- ☐ Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain]: Stable.
Presence of Run/Riffle/Pool Complexes. Explain: Not present.
Tributary Geometry: Relatively Straight
Tributary Gradient (approximate average slope): 1%

(c) Flow

Tributary Provides for: Ephemeral Flow
Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:
Subsurface Flow: No Explain:
☐ Dye (or other) test performed:

Tributary Has (Check all that apply):
- ☐ Bed and Banks
- ☑ OHWM (check all the apply): OHWM Indicators:
  - ☑ Clear, natural line impressed on the bank
  - ☑ Changes in soil character
  - ☑ Shelving
  - ☑ Vegetation matted down, bent or absent
  - ☑ Leaf litter disturbed or washed away
  - ☑ Sediment deposition
  - ☑ Water staining
  - ☐ Presence of litter and debris
  - ☐ Destruction of terrestrial vegetation
  - ☐ Presence of wrack line
  - ☐ Sediment sorting
  - ☑ Scour
  - ☐ Multiple observed or predicted flow events
  - ☐ Abrupt change in plant community
- ☐ Other (list):
- ☐ Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by:  
  - oil or scum line along shore objects  
  - fine shell or debris deposits (foreshore)  
  - physical markings/characteristics  
  - tidal gauges  
  - other

- Mean High water Mark indicated by:
  - survey to available datum  
  - physical markings  
  - vegetation lines/changes in vegetation types

(iii) Chemical Characteristics:
Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):
Explain:
Identify Specific Pollutants, if known:

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics:
- Wetland Fringe Characteristics:

Habitat for:
- Federally Listed Species Explain findings:
- Fish/Spawn Areas Explain findings:
- Other environmentally-sensitive species Explain findings:
- Aquatic/Wildlife diversity Explain:

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics
Properties:
- Wetland Size (ac):
- Wetland Type, Explain:
- Wetland Quality, Explain:

Project Wetlands Cross or Serve as State Boundaries, Explain:

(b) General Flow Relationship with Non-TNW:
- Wetland Flow is: Explain:
- Surface Flow is: Characteristics:
- Subsurface Flow: Explain Findings:

(c) Wetland Adjacency Determination with Non-TNW:
- Wetland Not Directly Abutting Non-TNW
- Discrete wetland hydrologic connection Explain:
- Ecological connection Explain:
- Separated by berm/barrier Explain:

(d) Proximity (Relationship) to TNW
- Project Wetlands: River Miles from TNW:
- Project Wetlands: Aerial Miles from TNW:
- Flow is From:
- Estimate approximate Location of Wetland within Floodplain:
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Identify specific pollutants, if known:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer Characteristics (type, average width):
- Vegetation type/percent cover. Explain:
- Habitat for:
  - Federally Listed Species Explain:
  - Fish/Spawn Areas Explain:
  - Other environmentally-sensitive species Explain:
  - Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

### D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. **TNWs and Adjacent Wetlands.** Check all that apply and provide size estimates in review area:

   - [ ] TNWs
   - [ ] Wetlands adjacent to TNWs

   **Linear Feet:**
   **Width (ft):**
   **TNW Acres**

2. **RPWs that flow directly or indirectly into TNWs**

   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and rationale indicating that tributary is perennial:
   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - [ ] Tributary waters
       - [ ] Other non-wetland waters

   **Linear Feet:**
   **Width (Ft):**
   **Acres:**

3. **Non-RPWs that flow directly or indirectly into TNWs.**

   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet):
     - Width (feet):
     - Acres:

4. **Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.**

   - [ ] Wetlands directly abutting RPW and thus are jurisdictional as adjacent wetlands.
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW

   - Provide acreage estimates for jurisdictional wetland in the review area:

5. **Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW**

   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

   - Provide acreage estimates for jurisdictional wetland in the review area:

6. **Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.**
Feature ID: 276

U.S. Army Corps of Engineers

☐ Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres): 

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: 

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale: 

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section III.C.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):

☐ Other Non-wetland Waters MBR acres:

☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 592.25 linear feet, 4.11 width (ft)

☐ Other waters acres

☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

**SECTION II: SUMMARY OF FINDINGS**

**A. RHA SECTION 10 DETERMINATION OF JURISDICTION**

There are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

**B. CWA SECTION 404 DETERMINATION OF JURISDICTION**

There are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters Linear Feet Width (ft) and/or Acres

      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: 
   - □ Vegetation
   - Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   - Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary, that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) **General Area Conditions:**
      - Watershed Size (sq mi): 49650
      - Drainage Area (sq mi): 0.01168
      - Average Annual Rainfall (in): 10
      - Average Annual Snowfall (in): 0
   (ii) **Physical Characteristics:**
      (a) Relationship with TNW
         - □ Tributary flows directly to TNW
         - ✔ Tributary flows through 4 tributaries before entering TNW
         - Project waters are 30 (or more) river miles from TNW
(b) General Tributary Characteristics

Tributary properties with respect to top of bank (estimate):
- Average Width (ft):
- Average Depth (ft): 
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Gravel
- Substrate - Vegetation
- Other, Explain: 

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs
     - Linear Feet: _______ Width (ft): _______ TNW Acres: _______
   - Wetlands adjacent to TNWs: Acres: _______

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: _______
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: _______
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: _______ Width (Ft): _______
       - Other non-wetland waters: Acres: _______

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet): _______ Width (feet): _______ Acres: _______

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: _______
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: _______
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
   - Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
277

Feature ID:

APPROVED JURISDICTIONAL DETERMINATION FORM
U.S Army Corps of Engineers

☐ Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C..

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):

☐ Other Non-wetland Waters MBR acres:

☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters 401.83 linear feet (ft), 3.97 width (ft)

☐ Other waters acres

☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☐ Office (Desk) Determination. Date:  
☐ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS
A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):
☐ TNWs (new)  
☐ Wetlands adjacent to TNWs  
☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
☐ Non-RPWs that flow directly or indirectly into TNWs  
☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
☐ Impoundments of jurisdictional waters  
☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

Non-Wetlands waters Linear Feet Width (ft) and/or Acres

Wetlands Acres:  

c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☐ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: 
   ☐ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.02058
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
      (a) Relationship with TNW
         □ Tributary flows directly to TNW
         ☑ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:  
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:  
Project waters are aerial (straight) miles from tributary to RPW:  
Project waters cross or serve as state boundaries. Explain:  
Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:  
Tributary properties with respect to top of bank (estimate):
- Average Width (ft):  
- Average Depth (ft):  
- Average Side Slopes: 3:1  
Primary tributary substrate composition (check all that apply):

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW
(i) Physical Characteristics:
(a) General Wetland Characteristics
Properties:
- Wetland Size (ac):
- Wetland Type, Explain:
- Wetland Quality, Explain:
- Project Wetlands Cross or Serve as State Boundaries, Explain:

(b) General Flow Relationship with Non-TNW:
- Wetland Flow is: Explain:
- Surface Flow is:
  - Characteristics:
  - Subsurface Flow: Explain Findings:

(c) Wetland Adjacency Determination with Non-TNW:
- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW
  - Discrete wetland hydrologic connection Explain:
  - Ecological connection Explain:
  - Separated by berm/barrier Explain:

(d) Proximity (Relationship) to TNW
- Project Wetlands: River Miles from TNW:
- Project Wetlands: Aerial Miles from TNW:
- Flow is From:
- Estimate approximate Location of Wetland within Floodplain:
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.)

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer Characteristics (type, average width):
- Vegetation type/percent cover. Explain:
- Habitat for:
  - Federally Listed Species Explain:
  - Fish/Spawn Areas Explain:
  - Other environmentally-sensitive species Explain:
  - Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.
   Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

   This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs Linear Feet: ______ Width (ft): ______ TNW Acres ______
   - Wetlands adjacent to TNWs: Acres: ______

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: ______
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: ______
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: ______ Width (ft): ______
       - Other non-wetland waters: Acres: ______

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

     Provide estimates of jurisdictional waters within the review area (check all that apply):
     Length (Linear Feet): ______ Width (feet): ______ Acres: ______

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: ______
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: ______

     Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

     Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR: acres:
- Wetlands MBR: acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters: 1323.64 linear feet, 4.27 width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

**Additional Comments to Support JD:**
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

**SECTION I: BACKGROUND INFORMATION**

**A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)**

July 5, 2013

**B. DISTRICT OFFICE, FILE NAME, AND NUMBER**

Los Angeles District, File No. Pending

**C. PROJECT LOCATION AND BACKGROUND INFORMATION:** Drainage Feature 279

**State:** AZ  
**County/Parish/borough:** Pinal County  
**City:** N/A

Center coordinates of site:  
Lat. 32.8482°N  
Long. -111.2599°W

Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request  
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

**D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)**

☐ Office (Desk) Determination. Date:  
☑ Field Determination. Date(s): 10/2012

**SECTION II: SUMMARY OF FINDINGS**

**A. RHA SECTION 10 DETERMINATION OF JURISDICTION**

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

**B. CWA SECTION 404 DETERMINATION OF JURISDICTION**

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

   ☐ TNWs (new)  
   ☐ Wetlands adjacent to TNWs  
   ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
   ☐ Non-RPWs that flow directly or indirectly into TNWs  
   ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
   ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
   ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
   ☐ Impoundments of jurisdictional waters  
   ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in review area

   Non-Wetlands waters Linear Feet Width (ft) and/or Acres  
   Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

   Identify TNW: [___]  □ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

<table>
<thead>
<tr>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Watershed Size (sq mi)</td>
<td>49650</td>
</tr>
<tr>
<td>Drainage Area (sq mi)</td>
<td>0.03573</td>
</tr>
<tr>
<td>Average Annual Rainfall (in)</td>
<td>10</td>
</tr>
<tr>
<td>Average Annual Snowfall (in)</td>
<td>0</td>
</tr>
</tbody>
</table>

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   □ Tributary flows directly to TNW
   ✔ Tributary flows through 4 tributaries before entering TNW

   Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW: 
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: 
Project waters are aerial (straight) miles from tributary to RPW: 
Project waters cross or serve as state boundaries. Explain: 

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClelian Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics
Tributary is: Natural Explain: 

Tributary properties with respect to top of bank (estimate):
Average Width (ft): 
Average Depth (ft): 
Average Side Slopes: 3:1 
Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Gravel
- Substrate - Vegetation
Other, Explain: 

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain]: Stable.
Presence of Run/Riffle/Pool Complexes. Explain: Not present.
Tributary Geometry: Relatively Straight
Tributary Gradient (approximate average slope): 1%

(c) Flow:
Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5
Describe Flow Regime: Ephemeral.
Other Information on Duration and Volume: 

Surface Flow is: Discrete and Confined Characteristics: 
Subsurface Flow: No Explain: 

Dye (or other) test performed: 

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community
Other (list): 

Discontinuous? Explain: 

If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- [ ] High tide line indicated by: ______________________
- [ ] Mean High water Mark indicated by: ______________________
- [ ] oil or scum line along shore objects
- [ ] fine shell or debris deposits (foreshore)
- [ ] physical markings/characteristics
- [ ] tidal gauges
- [ ] other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):
Explain: ______________________

Identify Specific Pollutants, if known: ______________________

(iv) Biological Characteristics. Channel supports (check all that apply):

- [ ] Riparian Corridor Characteristics: ______________________
- [ ] Wetland Fringe Characteristics: ______________________

Habitat for:
- [ ] Federally Listed Species Explain findings: ______________________
- [ ] Fish/Spawn Areas Explain findings: ______________________
- [ ] Other environmentally -sensitive species Explain findings: ______________________
- [ ] Aquatic/Wildlife diversity Explain: ______________________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics
Properties:
- [ ] Wetland Size (ac): ______________________
- [ ] Wetland Type, Explain: ______________________
- [ ] Wetland Quality, Explain: ______________________

Project Wetlands Cross or Serve as State Boundaries, Explain: ______________________

(b) General Flow Relationship with Non-TNW:
- [ ] Wetland Flow is: ______________________ Explain: ______________________
- [ ] Surface Flow is: ______________________
  - [ ] Characteristics: ______________________
- [ ] Subsurface Flow: ______________________ Explain Findings: ______________________

(c) Wetland Adjacency Determination with Non-TNW:
- [ ] Wetland Directly Abutting Non-TNW
- [ ] Wetland Not Directly Abutting Non-TNW
  - [ ] Discrete wetland hydrologic connection Explain: ______________________
  - [ ] Ecological connection Explain: ______________________
  - [ ] Separated by berm/barrier Explain: ______________________

(d) Proximity (Relationship) to TNW
- [ ] Project Wetlands: River Miles from TNW: ______________________
- [ ] Project Wetlands: Aerial Miles from TNW: ______________________
- [ ] Flow is From: ______________________
- [ ] Estimate approximate Location of Wetland within Floodplain: ______________________
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer  Characteristics (type, average width):
- Vegetation  type/percent cover. Explain:
- Habitat for:
  - Federally Listed Species  Explain:
  - Fish/Spawn Areas  Explain:
  - Other environmentally-sensitive species  Explain:
  - Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

☐ TNWs Linear Feet: Width (ft): TNW Acres
☐ Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs

☐ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

☐ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

Provide estimates for jurisdictional waters in the review are (check all that apply):

☐ Tributary waters Linear Feet: Width (Ft).
☐ Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

☐ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

Provide estimates of jurisdictional waters within the review area (check all that apply):

Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

☐ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

☐ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

☐ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW

Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

☐ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): _______ Acres: _______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: _______ width (ft): _______
☐ Other Non-wetland Waters MBR acres: _______
☐ Wetlands MBR acres: _______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters 1048.32 linear feet (ft), 4.37 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

**SECTION I: BACKGROUND INFORMATION**

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 28  
State: AZ
County/Parish/borough: Pinal County
City: N/A

Center coordinates of site:  
Lat. 32.8482°N  
Long. -111.2599°W

Name of nearest waterbody: 
Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

**D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)**

- [ ] Office (Desk) Determination. Date:  
- [x] Field Determination. Date(s): 10/2012

**SECTION II: SUMMARY OF FINDINGS**

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There **Are No** "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

- [x] Waters subject to the ebb and flow of the tide.
- [x] Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There **Are No** "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   
   a. Indicate presence of water of U.S. in review area (Check all the apply):
   
   - [ ] TNWs (new)
   - [ ] Wetlands adjacent to TNWs
   - [ ] Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
   - [ ] Non-RPWs that flow directly or indirectly into TNWs
   - [ ] Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
   - [ ] Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
   - [ ] Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
   - [ ] Impoundments of jurisdictional waters
   - [ ] Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
   
<table>
<thead>
<tr>
<th>Non-Wetlands waters</th>
<th>Linear Feet</th>
<th>Width (ft) and/or</th>
<th>Acres</th>
</tr>

</tr>
</tbody>
</table>

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

- [x] Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   **Explain:** Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: [ ]
   - Vegetation [ ]

   Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) **General Area Conditions:**

   - Watershed Size (sq mi): 49650
   - Drainage Area (sq mi): 0.00771
   - Average Annual Rainfall (in): 10
   - Average Annual Snowfall (in): 0

   (ii) **Physical Characteristics:**

   (a) **Relationship with TNW**

   - Tributary flows directly to TNW [ ]
   - Tributary flows through [4] tributaries before entering TNW
   - Project waters are 30 (or more) river miles from TNW
Feature ID: 28

APPROVED JURISDICTIONAL DETERMINATION FORM
U.S. Army Corps of Engineers

Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
Average Width (ft):
Average Depth (ft):
Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- [ ] Silts
- [ ] Sands
- [ ] Concrete
- [ ] Muck
- [ ] Cobble
- [ ] Gravel
- [ ] Substrate - Vegetation
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5
Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics: 
Subsurface Flow: No Explain:

Dye (or other) test performed:

Tributary Has (Check all that apply):
- [ ] Bed and Banks
- [x] OHWM (check all the apply): OHWM Indicators:
  - [x] Clear, natural line impressed on the bank
  - [x] Changes in soil character
  - [ ] Shelving
  - [ ] Vegetation matted down, bent or absent
  - [ ] Leaf litter disturbed or washed away
  - [ ] Sediment deposition
  - [ ] Water staining
  - Other (list):
  - [ ] Discontinuous? Explain:

- [ ] Presence of litter and debris
- [ ] Destruction of terrestrial vegetation
- [ ] Presence of wrack line
- [ ] Sediment sorting
- [ ] Scour
- [ ] Multiple observed or predicted flow events
- [ ] Abrupt change in plant community
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: ________________________________
- Mean High water Mark indicated by: ____________________________
- oil or scum line along shore objects
- fine shell or debris deposits (foreshore)
- physical markings/characteristics
- tidal gauges
- other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: ____________________________________________________

Identify Specific Pollutants, if known: ______________________________

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: ______________________________
- Wetland Fringe Characteristics: ________________________________

Habitat for:

- Federally Listed Species Explain findings: ______________________
- Fish/Spawn Areas Explain findings: ______________________________
- Other environmentally sensitive species Explain findings: __________
- Aquatic/Wildlife diversity Explain: ______________________________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:
- Wetland Size (ac): __________________
- Wetland Type, Explain: __________________
- Wetland Quality, Explain: __________________
- Project Wetlands Cross or Serve as State Boundaries, Explain: __________

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: __________________ Explain: ______________________
- Surface Flow is: __________________
- Characteristics: ______________
- Subsurface Flow: __________________ Explain Findings: __________

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Not Directly Abutting Non-TNW
- Discrete wetland hydrologic connection Explain: __________________
- Ecological connection Explain: __________________
- Separated by berm/barrier Explain: __________________

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: _________________________
- Project Wetlands: Aerial Miles from TNW: _______________________
- Flow is From: __________________________
- Estimate approximate Location of Wetland within Floodplain: __________
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

☐ Riparian Buffer Characteristics (type, average width):

☐ Vegetation type/percent cover. Explain:

Habitat for:

☐ Federally Listed Species Explain:

☐ Fish/Spawn Areas Explain:

☐ Other environmentally-sensitive species Explain:

☐ Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT Nexus DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

   - [ ] TNWs
   - [ ] Wetlands adjacent to TNWs

2. RPWs that flow directly or indirectly into TNWs

   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
   - [ ] Provide estimates for jurisdictional waters in the review area (check all that apply):
   - [ ] Tributary waters
   - [ ] Other non-wetland waters

3. Non-RPWs that flow directly or indirectly into TNWs.

   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

   - Provide estimates of jurisdictional waters within the review area (check all that apply):
   - [ ] Length (Linear Feet): Width (ft): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

   - [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
   - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
   - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:

   - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

   - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): _______ Acres: _______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): _______ linear feet: _______ width (ft): _______
- Other Non-wetland Waters MBR _______ acres: _______
- Wetlands MBR _______ acres: _______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters
  - Linear feet: _______ width (ft): _______
- Other waters _______ acres
- Wetlands _______ acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

- Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.
- Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant

- Office Concurs with data sheets/delineation report
- Office Does Not Concur with data sheets/delineation report

- Data Sheets Prepared by the Corps

☐ Office (Desk) Determination. Date:

☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in review area

      Non-Wetlands waters Linear Feet Width (ft) and/or Acres

      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: [ ] Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.00760
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         [ ] Tributary flows directly to TNW
         [ ] Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
### Project waters are
- river Miles from tributary to RPW: [Blank]
- Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: [Blank]
- Project waters are [Blank] aerial (straight) miles from tributary to RPW: [Blank]
- Project waters cross or serve as state boundaries. Explain: [Blank]
- Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

#### (b) General Tributary Characteristics

- Tributary is: Natural [Blank]
- Tributary properties with respect to top of bank (estimate):
  - Average Width (ft): [Blank]
  - Average Depth (ft): [Blank]
  - Average Side Slopes: 3:1
- Primary tributary substrate composition (check all that apply):
  - [ ] Silts
  - [ ] Sands
  - [ ] Concrete
  - [ ] Muck
  - [ ] Cobble
  - [ ] Gravel
  - [ ] Substrate - Vegetation
  - Other, Explain: [Blank]
- Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.]
- Presence of Run/Riffle/Pool Complexes. Explain: Not present.
- Tributary Geometry: Relatively Straight [Blank]
- Tributary Gradient (approximate average slope): 1%

(c) Flow:

- Tributary Provides for: Ephemeral Flow [Blank]
- Estimate average number of flow events in review area/year: 2-5
- Describe Flow Regime: Ephemeral.
- Other Information on Duration and Volume: [Blank]
- Surface Flow is: Discrete and Confined [Blank]
- Subsurface Flow: No [Blank]
- Dye (or other) test performed: [Blank]

- Tributary Has (Check all that apply):
  - [ ] Bed and Banks
  - [ ] OHWM (check all the apply): OHWM Indicators:
    - [ ] Clear, natural line impressed on the bank
    - [ ] Changes in soil character
    - [ ] Shelving
    - [ ] Vegetation matted down, bent or absent
    - [ ] Leaf litter disturbed or washed away
    - [ ] Sediment deposition
    - [ ] Water staining
    - Other (list): [Blank]
  - [ ] Discontinuous? Explain: [Blank]
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- [ ] High tide line indicated by: ____________________________
- [ ] Mean High water Mark indicated by: _______________________
- [ ] oil or scum line along shore objects
- [ ] fine shell or debris deposits (foreshore)
- [ ] physical markings/characteristics
- [ ] tidal gauges
- [ ] other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: ______________________________________________________

Identify Specific Pollutants, if known: ______________________________

(iv) Biological Characteristics. Channel supports (check all that apply):

- [ ] Riparian Corridor  Characteristics: __________________________
- [ ] Wetland Fringe  Characteristics: ____________________________

Habitat for:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

   □ TNWs                           Linear Feet: __________ Width (ft): __________ TNW Acres __________

   □ Wetlands adjacent to TNWs:     Acres: __________

2. RPWs that flow directly or indirectly into TNWs

   □ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: __________________________

   □ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: __________________________

   Provide estimates for jurisdictional waters in the review area (check all that apply):

   □ Tributary waters               Linear Feet: __________ Width (ft): __________ Acres: __________

   □ Other non-wetland waters:      Acres: __________

3. Non-RPWs that flow directly or indirectly into TNWs.

   □ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

   Provide estimates of jurisdictional waters within the review area (check all that apply):

   Length (Linear Feet): __________ Width (feet): __________ Acres: __________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

   □ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

   □ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: __________________________

   □ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: __________________________

   Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   □ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

   Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Feature ID: 280

APPROVED JURISDICTIONAL DETERMINATION FORM
U.S. Army Corps of Engineers

☐ Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C..

Provide estimates for jurisdictional wetland in the review area (in acres): 

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: 

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale: 
Length (linear feet): Acres: 

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters 

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non-wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
☐ Other Non-wetland Waters MBR acres:
☐ Wetlands MBR acres: 

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 668.93 linear feet (ft), 3.87 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

**Additional Comments to Support JD:**
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:  
Drainage Feature 281

State: AZ County/Parish/borough: Pinal County City: N/A

Center coordinates of site: Lat. 32.8482°N Long. -111.2599°W

Name of nearest waterbody: 
Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: 

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:

☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There are no "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There are no "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):

☐ TNWs (new)

☐ Wetlands adjacent to TNWs

☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs

☐ Non-RPWS that flow directly or indirectly into TNWs

☐ Wetlands directly abutting RPWS that flow directly or indirectly into TNWs

☐ Wetlands adjacent to but not directly abutting RPWS that flow directly or indirectly into TNWs

☐ Wetlands adjacent to non-RPWS that flow directly or indirectly into TNWs

☐ Impoundments of jurisdictional waters

☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

Non-Wetlands waters Linear Feet Width (ft) and/or Acres

Wetlands Acres:

c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: __________________________
   - ☐ Vegetation

   Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   - Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting TNWs, or if the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. **Characteristics of non-TNWs that flow directly or indirectly into TNW**
   (i) **General Area Conditions:**
      - Watershed Size (sq mi): 49650
      - Drainage Area (sq mi): 0.00358
      - Average Annual Rainfall (in): 10
      - Average Annual Snowfall (in): 0

   (ii) **Physical Characteristics:**
      - ☐ Tributary flows directly to TNW
      - ☑ Tributary flows through 4 tributaries before entering TNW
      - Project waters are 30 (or more) river miles from TNW
(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Cobbles
- Bedrock
- Sands
- Concrete
- Gravel
- Substrate - Vegetation
- Muck
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.]

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:

Subsurface Flow: No Explain:

Dye (or other) test performed:

Tributary Has (Check all that apply):

- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community

Other (list):

Discontinuous? Explain:
281

Feature ID: APPROVED JURISDICTIONAL DETERMINATION FORM
U.S. Army Corps of Engineers

If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by:
- Mean High water Mark indicated by:
- oil or scum line along shore objects
- fine shell or debris deposits (foreshore)
- physical markings/characteristics
- tidal gauges
- other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands.  Check all that apply and provide size estimates in review area:
   - TNWs  Linear Feet: Width (ft): TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters  Linear Feet: Width (Ft).
       - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW
       - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
281

Feature ID: 281

Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC.2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters linear feet (ft), width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

**Additional Comments to Support JD:**
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

### SECTION I: BACKGROUND INFORMATION

**A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)**
- July 5, 2013

**B. DISTRICT OFFICE, FILE NAME, AND NUMBER**
- Los Angeles District, File No. Pending

**C. PROJECT LOCATION AND BACKGROUND INFORMATION:**
- **Drainage Feature 282**
  - **State:** AZ
  - **County/Parish/borough:** Pinal County
  - **City:** N/A
  - **Center coordinates of site:** Lat. 32.8482°N, Long. -111.2599°W
  - **Name of nearest waterbody:**
    - Gila River between Powers Butte and Gillespie Dam
  - **Name of watershed or Hydrologic Unit Code (HUC):** 15050100

- Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
- Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

### SECTION II: SUMMARY OF FINDINGS

#### A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There are no "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

- Waters subject to the ebb and flow of the tide.
- Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

#### B. CWA SECTION 404 DETERMINATION OF JURISDICTION

- There are no "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. **Waters of the U.S.**
   - **a. Indicate presence of water of U.S. in review area (Check all the apply):**
     - TNWs (new)
     - Wetlands adjacent to TNWs
     - Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
     - Non-RPWs that flow directly or indirectly into TNWs
     - Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
     - Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
     - Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
     - Impoundments of jurisdictional waters
     - Isolated (interstate or intrastate) waters, including isolated wetlands
   - **b. Identify (estimate) size of waters of the U.S. in review area**
     - Non-Wetlands Linear Feet Width (ft) and/or Acres
     - Wetlands Acres:
   - **c. Limits (boundaries) of Jurisdiction based on:**

2. **Non-Regulated Waters/Wetlands (check if applicable):**
   - Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
   - **Explain:** Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTIOIN III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1; otherwise, see Section III.B below.

1. TNW
   Identify TNW: 
   □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary, it is necessary to determine whether the tributary is a tributary to the TNW.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.12144
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         □ Tributary flows directly to TNW
         □ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
The text contains a form with various sections and fields that need to be filled in. Here is a structured representation of the content:

### General Tributary Characteristics

- **Tributary is:** Natural

- **Average Width (ft):** 

- **Average Depth (ft):** 

- **Average Side Slopes:** 3:1

- **Primary tributary substrate composition:**
  - Silts
  - Gravel
  - Substrate - Vegetation
  - Other, Explain: 

- **Tributary Condition/Stability:** Stable

- **Presence of Run/Riffle/Pool Complexes:** Not present

- **Tributary Geometry:** Relatively Straight

- **Tributary Gradient (approximate average slope):** 1%

### Flow

- **Tributary Provides for:** Ephemeral Flow

- **Describe Flow Regime:** Ephemeral

- **Estimate average number of flow events in review area/year:** 2-5

- **Surface Flow is:** Discrete and Confined

- **Subsurface Flow:** No

- **Dye (or other) test performed:** 

### Additional Information

- **Project waters are** river Miles from tributary to RPW:

- **Project waters are** 30 (or more) aerial (straight) miles from tributary to TNW:

- **Project waters are** aerial (straight) miles from tributary to RPW:

- **Project waters cross or serve as state boundaries:** Explain:

- **Identify flow route to TNW:** Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

### Other Information

- **Bed and Banks**
- **OHWM (check all that apply):**
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Other (list): 

- **Discontinuous?** Explain: 

---

**Feature ID:** 282
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW

- Discrete wetland hydrologic connection Explain: ______________________
- Ecological connection Explain: ______________________
- Separated by berm/barrier Explain: ______________________

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: ______________________

Project Wetlands: Aerial Miles from TNW: ______________________

Flow is From: ______________________

Estimate approximate Location of Wetland within Floodplain: ______________________
(ii) Chemical Characteristics:
Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).
Explain
Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):
- Riparian Buffer  Characteristics (type, average width):
- Vegetation  type/percent cover. Explain:
Habitat for:
- Federally Listed Species  Explain:
- Fish/Spawn Areas  Explain:
- Other environmentally-sensitive species  Explain:
- Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)
All wetland(s) being considered in cumulative analysis:
Wetland acres in total being considered in cumulative analysis:
Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION
A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.
Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:
This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

☐ Office (Desk) Determination. Date: 

☐ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No “navigable waters of the U.S.” within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No “waters of the U.S.” within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):

☐ TNWs (new)

☐ Wetlands adjacent to TNWs

☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs

☐ Non-RPWs that flow directly or indirectly into TNWs

☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs

☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs

☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs

☐ Impoundments of jurisdictional waters

☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

Non-Wetlands waters Linear Feet Width (ft) and/or Acres

Wetlands Acres:

C. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☒ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________________ □ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.05386
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         □ Tributary flows directly to TNW
         ✔ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
(b) General Tributary Characteristics

Tributary is: Natural

Tributary properties with respect to top of bank (estimate):
- Average Width (ft):  
- Average Depth (ft):  
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Cobble
- Gravel
- Substrate - Vegetation
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable]

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Surface Flow is: Discrete and Confined

Subsurface Flow: No

Dye (or other) test performed:

Other Information on Duration and Volume:

Tributary Has (Check all that apply):

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

   - TNWs: Linear Feet: ______ Width (ft): ______ TNW Acres: ______
   - Wetlands adjacent to TNWs: Acres: ______

2. RPWs that flow directly or indirectly into TNWs

   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: ______
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: ______
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters: Linear Feet: ______ Width (ft): ______
       - Other non-wetland waters: Acres: ______

3. Non-RPWs that flow directly or indirectly into TNWs.

   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet): ______ Width (feet): ______ Acres: ______

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: ______
     - Wetlands directly abutting an RPW where tributaries typically flow "seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: ______
       - Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): 
Acres: 

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters linear feet (ft), width (ft):
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

- Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.
- Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION
A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD) 

   July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER

   Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 284

   State: AZ  
   County/Parish/borough: Pinal County  
   City: N/A
   Center coordinates of site: Lat. 32.8482°N  Long. -111.2599°W
   Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam
   Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:
   Name of watershed or Hydrologic Unit Code (HUC): 15050100
   ☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
   ☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

   ☐ Office (Desk) Determination. Date:
   ☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

   There ☑ No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

   ☐ Waters subject to the ebb and flow of the tide.
   ☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

   There ☑ No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

   1. Waters of the U.S.

      a. Indicate presence of water of U.S. in review area (Check all the apply):

         ☐ TNWs (new)
         ☐ Wetlands adjacent to TNWs
         ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
         ☐ Non-RPws that flow directly or indirectly into TNWs
         ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands adjacent to non-RPws that flow directly or indirectly into TNWs
         ☐ Impoundments of jurisdictional waters
         ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

      b. Identify (estimate) size of waters of the U.S. in the review area

         Non-Wetlands waters _______________ Linear Feet _______________ Width (ft) and/or _______________ Acres

         Wetlands Acres: _______________

   c. Limits (boundaries) of Jurisdiction based on:

   2. Non-Regulated Waters/Wetlands (check if applicable):

      ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1.; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW: ___________________________  □ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

(i) General Area Conditions:

<table>
<thead>
<tr>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Watershed Size (sq mi)</td>
<td>49650</td>
</tr>
<tr>
<td>Drainage Area (sq mi)</td>
<td>0.00064</td>
</tr>
<tr>
<td>Average Annual Rainfall (in)</td>
<td>10</td>
</tr>
<tr>
<td>Average Annual Snowfall (in)</td>
<td>0</td>

</tbody>
</table>

(ii) Physical Characteristics:

(a) Relationship with TNW

☐ Tributary flows directly to TNW
☐ Tributary flows through _______ tributaries before entering TNW

Project waters are _______ (or more) river miles from TNW
(b) General Tributary Characteristics

Tributary is: Natural

Tributary properties with respect to top of bank (estimate):
- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Gravel
- Cobble
- Bedrock
- Substrate - Vegetation
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined

Subsurface Flow: No

Dye (or other) test performed: 

Tributary Has (Check all that apply):

- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining

  Other (list):

- Discontinuous? Explain:

Other Information on Duration and Volume:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: __________
- Mean High Water Mark indicated by: __________
- oil or scum line along shore objects
- fine shell or debris deposits (foreshore)
- physical markings/characteristics
- tidal gauges

  - Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical, and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- TNWs  Linear Feet: ______ Width (ft): ______ TNW Acres: ______
- Wetlands adjacent to TNWs: Acres: ______

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: ______
- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: ______
  - Provide estimates for jurisdictional waters in the review area (check all that apply):
    - Tributary waters  Linear Feet: ______ Width (ft): ______
    - Other non-wetland waters: Acres: ______

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
  - Provide estimates of jurisdictional waters within the review area (check all that apply):
    - Length (Linear Feet): ______ Width (feet): ______ Acres: ______

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: ______
  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: ______
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section III C.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):

☐ Other Non-wetland Waters MBR acres:

☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters linear feet (ft), width (ft)

☐ Other waters acres

☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)
   □ Office (Desk) Determination. Date:
   ☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION
   There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in
   the review area.
   □ Waters subject to the ebb and flow of the tide.
   □ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION
   There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.
   1. Waters of the U.S.
      a. Indicate presence of water of U.S. in review area (Check all the apply):
         ☑ TNWs (new)
         □ Wetlands adjacent to TNWs
         □ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
         □ Non-RPWs that flow directly or indirectly into TNWs
         □ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
         □ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
         □ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
         □ Impoundments of jurisdictional waters
         □ Isolated (interstate or intrastate) waters, including isolated wetlands
      b. Identify (estimate) size of waters of the U.S. in the review area
         Non-Wetlands waters Linear Feet Width (ft) and/or Acres
         Wetlands Acres:
      c. Limits (boundaries) of Jurisdiction based on:

   2. Non-Regulated Waters/Wetlands (check if applicable):
      ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
         Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered
         jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a
         significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: 
   - □ Vegetation

   Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) **General Area Conditions:**
   - Watershed Size (sq mi): 49650
   - Drainage Area (sq mi): 0.02300
   - Average Annual Rainfall (in): 10
   - Average Annual Snowfall (in): 0

   (ii) **Physical Characteristics:**
   - □ Tributary flows directly to TNW
   - ✓ Tributary flows through __4__ tributaries before entering TNW
   - Project waters are __30 (or more)__ river miles from TNW
**Feature ID:** 285  
**U.S. Army Corps of Engineers**

1. **Project waters are** __river__ Miles from tributary to RPW: 
1. **Project waters are** __30 (or more) __aerial (straight) miles from tributary to TNW: 
1. **Project waters are** __aerial (straight) miles from tributary to RPW: 
1. **Project waters cross or serve as state boundaries.** Explain: 

**Identify flow route to TNW** Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

### (b) General Tributary Characteristics

**Tributary is:** Natural  
**Explain:**

Tributary properties with respect to top of bank (estimate):

  - Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)
- All wetland(s) being considered in cumulative analysis:
- Wetland acres in total being considered in cumulative analysis:
- Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION
A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.
   Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- TNWs Linear Feet: Width (ft): TNW Acres
- Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: 
- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: 
  Provide estimates for jurisdictional waters in the review are (check all that apply):
  - Tributary waters Linear Feet: Width (Ft).
  - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c. Provide estimates of jurisdictional waters within the review area (check all that apply):
  Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: 
  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW 
  Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C. 
  Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
☐ Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): _______ Acres: _______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams) linear feet: _______ width (ft): _______
☐ Other Non-wetland Waters MBR acres: _______
☐ Wetlands MBR acres: _______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters linear feet (ft), 775.16 width (ft), 4.35
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

Additional Comments to Support JD:
SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:  
Drainage Feature 286  
State: AZ  
County/Parish/borough: Pinal County  
City: N/A  
Center coordinates of site: Lat. 32.8482°N Long. -111.2599°W

Name of nearest waterbody:  
Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  
Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC):  
15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)
☐ Office (Desk) Determination. Date:  
☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There ☐/☐ Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There ☐/☐ Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):
☐ TNWs (new)
☐ Wetlands adjacent to TNWs
☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
☐ Non-RPWs that flow directly or indirectly into TNWs
☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
☐ Impoundments of jurisdictional waters
☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

Non-Wetlands waters Linear Feet Width (ft) and/or Acres

Wetlands Acres:

C. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: 
   - Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   - Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   
   (i) General Area Conditions:
   - Watershed Size (sq mi): 49650
   - Drainage Area (sq mi): 0.00114
   - Average Annual Rainfall (in): 10
   - Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
   
   (a) Relationship with TNW
   - [ ] Tributary flows directly to TNW
   - [ ] Tributary flows through ____ tributaries before entering TNW
   - Project waters are ____ river miles from TNW
Feature ID: 286

(b) General Tributary Characteristics

Tributary is: Natural

Tributary properties with respect to top of bank (estimate):
- Average Width (ft): 
- Average Depth (ft): 
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Cobbles
- Gravel
- Substrate - Vegetation
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain]: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined

Subsurface Flow: No

Dye (or other) test performed:

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community

Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: [ ]
- Mean High water Mark indicated by: [ ]
- Oil or scum line along shore objects [ ]
- Fine shell or debris deposits (foreshore) [ ]
- Physical markings/characteristics [ ]
- Tidal gauges [ ]
- Other [ ]

### (iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

- Surface Flow is: [ ]

Characteristics: [ ]

Subsurface Flow: [ ] Explain Findings: [ ]

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW [ ]
- Wetland Not Directly Abutting Non-TNW [ ]

Discrete wetland hydrologic connection Explain: [ ]

Ecological connection Explain: [ ]

Separated by berm/barrier Explain: [ ]

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: [ ]

Project Wetlands: Aerial Miles from TNW: [ ]

Flow is From: [ ]

Estimate approximate Location of Wetland within Floodplain: [ ]
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

☐ Riparian Buffer   Characteristics (type, average width):

☐ Vegetation type/percent cover. Explain:

Habitat for:

☐ Federally Listed Species   Explain:

☐ Fish/Spawn Areas   Explain:

☐ Other environmentally-sensitive species   Explain:

☐ Aquatic/Wildlife Diversity   Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

☐ TNWs  Linear Feet: _______ Width (ft): _______ TNW Acres _______

☐ Wetlands adjacent to TNWs: Acres: _______

2. RPWs that flow directly or indirectly into TNWs

☐ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: _______

☐ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: _______

   Provide estimates for jurisdictional waters in the review area (check all that apply):

   ☐ Tributary waters  Linear Feet: _______ Width (Ft): _______

   ☐ Other non-wetland waters: Acres: _______

3. Non-RPWs that flow directly or indirectly into TNWs.

☐ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.

   Provide estimates of jurisdictional waters within the review area (check all that apply):

   Length (Linear Feet): _______ Width (feet): _______ Acres: _______

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

☐ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

   ☐ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: _______

   ☐ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: _______

   Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

☐ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

   Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): _______ Acres: _______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: _______ width (ft): _______

☐ Other Non-wetland Waters MBR acres: _______

☐ Wetlands MBR acres: _______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters 205.05 linear feet (ft), 4.01 width (ft)

☐ Other waters acres

☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☑ Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.

☑ Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD) July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 287
   State: AZ    County/Parish/borough: Pinal County    City: N/A
   Center coordinates of site: Lat. 32.8482°N Long. -111.2599°W
   Name of nearest waterbody:  
   Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: 
   Gila River between Powers Butte and Gillespie Dam
   Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g. offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)
   ☐ Office (Desk) Determination. Date:     ☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION
   There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.
   ☐ Waters subject to the ebb and flow of the tide.
   ☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION
   There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.
   1. Waters of the U.S.
      a. Indicate presence of water of U.S. in review area (Check all the apply):
         ☐ TNWs (new)
         ☐ Wetlands adjacent to TNWs
         ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
         ☐ Non-RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
         ☐ Impoundments of jurisdictional waters
         ☐ Isolated (interstate or intrastate) waters, including isolated wetlands
      b. Identify (estimate) size of waters of the U.S. in the review area
         Non-Wetlands waters Linear Feet Width (ft) and/or Acres
         Wetlands Acres: 
      c. Limits (boundaries) of Jurisdiction based on:
   2. Non-Regulated Waters/Wetlands (check if applicable):
      ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ______________________   ☐ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.00334
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         ☑ Tributary flows through
         ☐ Tributary flows directly to TNW
         tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
**Project waters are** 30 (or more) river miles from tributary to RPW:

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

---

### D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

#### 1. TNWs and Adjacent Wetlands.

Check all that apply and provide size estimates in review area:

<table>
<thead>
<tr>
<th></th>
<th>TNWs</th>
<th>Linear Feet:</th>
<th>Width (ft):</th>
<th>TNW Acres</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Wetlands adjacent to TNWs:</td>
<td>Acres:</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### 2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
  
  Provide estimates for jurisdictional waters in the review area (check all that apply):
  
  - Tributary waters: Linear Feet: Width (Ft).
  - Other non-wetland waters: Acres: 

#### 3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

Provide estimates of jurisdictional waters within the review area (check all that apply):

<table>
<thead>
<tr>
<th>Length (Linear Feet):</th>
<th>Width (feet):</th>
<th>Acres:</th>
</tr>
</thead>
</table>

#### 4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  
  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
  
  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW

Provide acreage estimates for jurisdictional wetland in the review area: Acres:

#### 5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetland in the review area: Acres:

#### 6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
□ Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres): __________

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: __________

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale: __________

Length (linear feet): __________ Acres: __________

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters __________

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

□ Non wetland-Waters (i.e., rivers, streams): __________ linear feet : __________ width (ft): __________

□ Other Non-wetland Waters MBR __________ acres: __________

□ Wetlands MBR __________ acres: __________

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters __________ linear feet (ft), __________ width (ft)

□ Other waters __________ acres

□ Wetlands __________ acres

SECTION IV: DATA SOURCES

         Non-Wetlands waters Linear Feet Width (ft) and/or Acres
         Wetlands Acres:
      c. Limits (boundaries) of Jurisdiction based on:
   2. Non-Regulated Waters/Wetlands (check if applicable):
      ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
         Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   
   Identify TNW: [ ]
   
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
   
   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.46436
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   [ ] Tributary flows directly to TNW
   [ ] Tributary flows through [ ] tributaries before entering TNW

   Project waters are [ ] river miles from TNW

   [ ] Tributary flows through

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and rationale indicating that tributary is perennial:

- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

  Provide estimates for jurisdictional waters in the review area (check all that apply):

  - Tributary waters
  - Other non-wetland waters

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.

  Provide estimates of jurisdictional waters within the review area (check all that apply):

  Length (Linear Feet): | Width (Feet): | Acres: |

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW

  Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

  Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
□ Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C..

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): _____ Acres: _____

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section III.C2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

□ Non wetland-Waters (i.e., rivers, streams): linear feet: _____ width (ft): _____
□ Other Non-wetland Waters MBR acres: _____
□ Wetlands MBR acres: _____

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters 1590.44 linear feet (ft), 8.38 width (ft)
□ Other waters acres
□ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☐ Office (Desk) Determination. Date:  
☑ Field Determination. Date(s): 10/2012

### SECTION II: SUMMARY OF FINDINGS

**A. RHA SECTION 10 DETERMINATION OF JURISDICTION**

There **Are No** "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

**B. CWA SECTION 404 DETERMINATION OF JURISDICTION**

There **Are No** "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):
      
      ☐ TNWs (new)  
      ☐ Wetlands adjacent to TNWs  
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
      ☐ Non-RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
      ☐ Impoundments of jurisdictional waters  
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres  
      Wetlands Acres:  

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**

   Identify TNW:  
   ☐ Vegetation

   Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) **General Area Conditions:**

   | Watershed Size (sq mi): | 49650 |
   | Drainage Area (sq mi): | 0.34529 |
   | Average Annual Rainfall (in): | 10 |
   | Average Annual Snowfall (in): | 0 |

   (ii) **Physical Characteristics:**

<table>
<thead>
<tr>
<th>Relationship with TNW</th>
</tr>
</thead>
<tbody>
<tr>
<td>☐ Tributary flows directly to TNW</td>
</tr>
<tr>
<td>☑ Tributary flows through 4 tributaries before entering TNW</td>
</tr>
</tbody>
</table>

   Project waters are 30 (or more) river miles from TNW
Feature ID: APPROVED JURISDICTIONAL DETERMINATION FORM
U.S Army Corps of Engineers

Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
Average Width (ft):
Average Depth (ft):
Average Side Slopes: 3:1

Provide estimates of jurisdictional waters within the review area (check all that apply):

| Description | | |
|-------------| | |

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

| Description | | |
|-------------| | |
| Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: |
| Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: |

Provide acreage estimates for jurisdictional wetland in the review area: Acres: |

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

| Description | | |
|-------------| | |
| Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C. |

Provide acreage estimates for jurisdictional wetland in the review area: Acres: |

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): _______ Acres: _______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section III.C.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: _______ width (ft): _______
☐ Other Non-wetland Waters MBR acres: _______
☐ Wetlands MBR acres: _______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 2403.62 linear feet (ft), 10.70 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION II: SUMMARY OF FINDINGS
A. RHA SECTION 10 DETERMINATION OF JURISDICATION
There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.
☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICATION
There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________________ ☐ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
   - Watershed Size (sq mi): 49650
   - Drainage Area (sq mi): 0.09228
   - Average Annual Rainfall (in): 10
   - Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
   - ☐ Tributary flows directly to TNW
   - ☐ Tributary flows through _______ tributaries before entering TNW
   - ☐ Project waters are _______ (or more) river miles from TNW

   (a) Relationship with TNW
   - ☐ Tributary flows directly to TNW
   - ☐ Tributary flows through _______ tributaries before entering TNW
   - ☐ Project waters are _______ (or more) river miles from TNW

   (b) Physical Characteristics:
   - Watershed Size (sq mi): _______ 
   - Drainage Area (sq mi): _______ 
   - Average Annual Rainfall (in): _______ 
   - Average Annual Snowfall (in): _______ 

   (c) Vegetation:
   - ☐ Woody vegetation
   - ☐ Aquatic vegetation
   - ☐ terrestrial vegetation
**Feature ID:** 29

**Project waters are**
- river Miles from tributary to RPW: 
- Project waters are **30 (or more)** aerial (straight) miles from tributary to TNW:
- Project waters are **aerial (straight) miles from tributary to RPW:**
- Project waters cross or serve as state boundaries. **Explain:**

**Identify flow route to TNW**
Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer Characteristics (type, average width):
- Vegetation type/percent cover. Explain:

Habitat for:
- Federally Listed Species Explain:
- Fish/Spawn Areas Explain:
- Other environmentally-sensitive species Explain:
- Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III-D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

☐ TNWs  Linear Feet:    Width (ft):    TNW Acres

☐ Wetlands adjacent to TNWs:  Acres:

2. RPWs that flow directly or indirectly into TNWs

☐ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

☐ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

Provide estimates for jurisdictional waters in the review area (check all that apply):

☐ Tributary waters  Linear Feet:    Width (Ft).

☐ Other non-wetland waters:  Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

☐ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

Provide estimates of jurisdictional waters within the review area (check all that apply):

Length (Linear Feet):    Width (feet):    Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

☐ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

☐ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

☐ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW

Provide acreage estimates for jurisdictional wetland in the review area:  Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

☐ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetland in the review area:  Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): [ ] Acres: [ ]

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non-wetland-Waters (i.e., rivers, streams): linear feet: [ ] width (ft): [ ]

☐ Other Non-wetland Waters MBR acres: [ ]

☐ Wetlands MBR acres: [ ]

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters 1272.30 linear feet (ft), 10.62 width (ft)

☑ Other waters acres

☐ Wetlands acres

SECTION IV: DATA SOURCES

☐ Office (Desk) Determination. Date:  
☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):

☐ TNWs (new)  
☐ Wetlands adjacent to TNWs  
☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
☐ Non-RPWs that flow directly or indirectly into TNWs  
☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
☐ Impoundments of jurisdictional waters  
☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

Non-Wetlands waters Linear Feet Width (ft) and/or Acres

Wetlands Acres:

 ☐

c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drains is ephemeral and does not qualify as a TNW or RPW. Therefore, this discharge could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This discharge does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________________ ☐ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.02611
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         ☐ Tributary flows directly to TNW
         ☑ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
**Project waters are** 30 (or more) aerial (straight) miles from tributary to TNW:

**Project waters are** aerial (straight) miles from tributary to RPW:

**Project waters cross or serve as state boundaries.** Explain:

**Identify flow route to TNW** Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. **TNWs and Adjacent Wetlands.** Check all that apply and provide size estimates in review area:

   - TNWs Linear Feet: [ ] Width (ft): [ ] TNW Acres [ ]
   - Wetlands adjacent to TNWs: Acres: [ ]

2. **RPWs that flow directly or indirectly into TNWs**

   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: [ ]
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: [ ]
     
     Provide estimates for jurisdictional waters in the review area (check all that apply):
     
     - Tributary waters Linear Feet: [ ] Width (Ft): [ ]
     - Other non-wetland waters: Acres: [ ]

3. **Non-RPWs that flow directly or indirectly into TNWs.**

   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     
     Provide estimates of jurisdictional waters within the review area (check all that apply):
     
     - Length (Linear Feet): [ ] Width (feet): [ ] Acres: [ ]

4. **Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.**

   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: [ ]
     
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: [ ]
     
     Provide acreage estimates for jurisdictional wetland in the review area: Acres: [ ]

5. **Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW**

   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     
     Provide acreage estimates for jurisdictional wetland in the review area: Acres: [ ]

6. **Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.**
Feature ID: 290

Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
☐ Other Non-wetland Waters MBR acres:
☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 1290.35 linear feet (ft), 5.71 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD): July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER: Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 291

State: AZ  County/Parish/borough: Pinal  City: N/A

Center coordinates of site: Lat. 32.8482°N  Long. -111.2599°W

Name of nearest waterbody:

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:

Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:

☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters  Linear Feet  Width (ft) and/or  Acres

      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________________ ☐ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland, that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.00657
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         ☐ Tributary flows directly to TNW
         ☑ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
(b) General Tributary Characteristics

Tributary is: Natural

Tributary properties with respect to top of bank (estimate):
- Average Width (ft): 
- Average Depth (ft): 
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Gravel
- Substrate - Vegetation

Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined
Subsurface Flow: No

Dye (or other) test performed: 

Tributary Has (Check all that apply):

- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community

Other (list):

Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):
- High tide line indicated by: [ ]
- Oil or scum line along shore objects [ ]
- Fine shell or debris deposits (foreshore) [ ]
- Physical markings/characteristics [ ]
- Tidal gauges [ ]
- Other [ ]
- Mean high water mark indicated by: [ ]

- Physical markings [ ]
- Vegetation lines/changes in vegetation types [ ]

(iii) Chemical Characteristics:
Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):
Explain: [ ]
Identify specific pollutants, if known: [ ]

(iv) Biological Characteristics. Channel supports (check all that apply):
- Riparian corridor characteristics: [ ]
- Wetland fringe characteristics: [ ]
Habitat for:
- Federally listed species explain findings: [ ]
- Fish/spawn areas explain findings: [ ]
- Other environmentally sensitive species explain findings: [ ]
- Aquatic/wildlife diversity explain: [ ]

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW
(i) Physical Characteristics:
(a) General Wetland Characteristics
Properties:
- Wetland size (ac): [ ]
- Wetland type, explain: [ ]
- Wetland quality, explain: [ ]
Project wetlands cross or serve as state boundaries, explain: [ ]
(b) General flow relationship with non-TNW:
Wetland flow is: [ ]
Explain: [ ]
Surface flow is: [ ]
Characteristics: [ ]
Subsurface flow: [ ]
Explain findings: [ ]
(c) Wetland Adjacency Determination with Non-TNW:
- Wetland directly abutting non-TNW: [ ]
- Wetland not directly abutting non-TNW: [ ]
  - Discrete wetland hydrologic connection explain: [ ]
  - Ecological connection explain: [ ]
  - Separated by berm/barrier explain: [ ]
(d) Proximity (relationship) to TNW
Project wetlands: river miles from TNW: [ ]
Project wetlands: aerial miles from TNW: [ ]
Flow is from: [ ]
Estimate approximate location of wetland within floodplain: [ ]
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer Characteristics (type, average width):
- Vegetation type/percent cover. Explain:

Habitat for:
- Federally Listed Species Explain:
- Fish/Spawn Areas Explain:
- Other environmentally-sensitive species Explain:
- Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below:

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

☐ TNWs Linear Feet: ______________ Width (ft): ______________ TNW Acres: ______________

☐ Wetlands adjacent to TNWs: Acres: ______________

2. RPWs that flow directly or indirectly into TNWs

☐ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: ______________

☐ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: ______________

Provide estimates for jurisdictional waters in the review area (check all that apply):

☐ Tributary waters Linear Feet: ______________ Width (Ft): ______________

☐ Other non-wetland waters: Acres: ______________

3. Non-RPWs that flow directly or indirectly into TNWs.

☐ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

Provide estimates of jurisdictional waters within the review area (check all that apply):

Length (Linear Feet): ______________ Width (feet): ______________ Acres: ______________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

☐ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

☐ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: ______________

☐ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: ______________

Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

☐ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters linear feet (ft), width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

Additional Comments to Support JD:
## APPROVED JURISDICTIONAL DETERMINATION FORM

**U.S Army Cops of Engineers**

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

### SECTION I: BACKGROUND INFORMATION

#### A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)

July 5, 2013

#### B. DISTRICT OFFICE, FILE NAME, AND NUMBER

Los Angeles District, File No. Pending

#### C. PROJECT LOCATION AND BACKGROUND INFORMATION:

**Drainage Feature 292**

- [x] Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
- [ ] Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

### D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

- [ ] Office (Desk) Determination. Date: 
- [x] Field Determination. Date(s): 10/2012

### SECTION II: SUMMARY OF FINDINGS

#### A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There **Are No” navigable waters of the U.S."** within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329 in the review area.

- [ ] Waters subject to the ebb and flow of the tide.
- [ ] Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

#### B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There **Are No”waters of the U.S."** within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. **Waters of the U.S.**
   
   a. **Indicate presence of water of U.S. in review area (Check all the apply):**
      
      - [ ] TNWs (new)
      - [ ] Wetlands adjacent to TNWs
      - [ ] Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      - [ ] Non-RPWs that flow directly or indirectly into TNWs
      - [ ] Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      - [ ] Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      - [ ] Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      - [ ] Impoundments of jurisdictional waters
      - [ ] Isolated (interstate or intrastate) waters, including isolated wetlands

   b. **Identify (estimate) size of waters of the U.S. in the review area**
      
      | Non-Wetlands waters | Linear Feet | Width (ft) and/or | Acres |
      |---------------------|-------------|-------------------|-------|
      | Wetlands Acres:     |             |                   |       |

   c. **Limits (boundaries) of Jurisdiction based on:**

   **2. Non-Regulated Waters/Wetlands (check if applicable):**
      
      - [x] Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

      **Explain:** Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW: [ ]

☐ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.08379
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   ☑ Tributary flows directly to TNW
   ☐ Tributary flows through 4 tributaries before entering TNW

   Project waters are 30 (or more) river miles from TNW
### General Tributary Characteristics

**Tributary is:** Natural  
**Explain:**

**Tributary properties with respect to top of bank (estimate):**
- **Average Width (ft):** [ ]
- **Average Depth (ft):** [ ]
- **Average Side Slopes:** 3:1

**Primary tributary substrate composition (check all that apply):**
- [ ] Silts
- [ ] Sands
- [ ] Concrete
- [ ] Muck
- [ ] Cobble
- [ ] Gravel
- [ ] Other, Explain: [ ]

**Substrate - Vegetation:**

**Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain:** Stable.

**Presence of Run/Riffle/Pool Complexes. Explain:** Not present.

**Tributary Geometry:** Relatively Straight

**Tributary Gradient (approximate average slope):** 1%

### Flow

**Tributary Provides for:** Ephemeral Flow

**Describe Flow Regime:** Ephemeral.

**Estimate average number of flow events in review area/year:** 2-5

**Other Information on Duration and Volume:**

**Surface Flow is:** Discrete and Confined

**Subsurface Flow:** No

**Dye (or other) test performed:** [ ]

**Tributary Has (Check all that apply):**
- [ ] Bed and Banks
- [ ] OHWM (check all the apply): OHWM Indicators:
  - [ ] Clear, natural line impressed on the bank
  - [ ] Changes in soil character
  - [ ] Shelving
  - [ ] Vegetation matted down, bent or absent
  - [ ] Leaf litter disturbed or washed away
  - [ ] Sediment deposition
  - [ ] Water staining
  - [ ] Presence of litter and debris
  - [ ] Destruction of terrestrial vegetation
  - [ ] Presence of wrack line
  - [ ] Sediment sorting
  - [ ] Scour
  - [ ] Multiple observed or predicted flow events
  - [ ] Abrupt change in plant community
  - [ ] Other (list): [ ]

**Discontinuous? Explain:** [ ]
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- □ High tide line indicated by: __________________________
- □ Mean High water Mark indicated by: __________________________
- □ oil or scum line along shore objects __________________________
- □ fine shell or debris deposits (foreshore) __________________________
- □ physical markings/characteristics __________________________
- □ tidal gauges __________________________
- □ other __________________________

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: __________________________

Identify Specific Pollutants, if known: __________________________

(iv) Biological Characteristics. Channel supports (check all that apply):

- □ Riparian Corridor Characteristics: __________________________
- □ Wetland Fringe Characteristics: __________________________

Habitat for:

- □ Federally Listed Species Explain findings: __________________________
- □ Fish/Spawn Areas Explain findings: __________________________
- □ Other environmentally -sensitive species Explain findings: __________________________
- □ Aquatic/Wildlife diversity Explain: __________________________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac): __________________________
- Wetland Type, Explain: __________________________
- Wetland Quality, Explain: __________________________

Project Wetlands Cross or Serve as State Boundaries, Explain: __________________________

(b) General Flow Relationship with Non-TNW:

- Wetland Flow is: __________________________ Explain: __________________________
- Surface Flow is: __________________________

Characteristics: __________________________

Subsurface Flow: __________________________ Explain Findings: __________________________

(c) Wetland Adjacency Determination with Non-TNW:

- □ Wetland Directly Abutting Non-TNW
- □ Wetland Not Directly Abutting Non-TNW

- □ Discrete wetland hydrologic connection Explain: __________________________
- □ Ecological connection Explain: __________________________
- □ Separated by berm/barrier Explain: __________________________

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: __________________________

Project Wetlands: Aerial Miles from TNW: __________________________

Flow is From: __________________________

Estimate approximate Location of Wetland within Floodplain: __________________________
(ii) Chemical Characteristics:
Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).
Explain
Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):
- Riparian Buffer Characteristics (type, average width):
- Vegetation type/percent cover. Explain:
Habitat for:
- Federally Listed Species Explain:
- Fish/Spawn Areas Explain:
- Other environmentally-sensitive species Explain:
- Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)
All wetland(s) being considered in cumulative analysis:
Wetland acres in total being considered in cumulative analysis:
Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION
A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: The above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.
Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands.  Check all that apply and provide size estimates in review area:
   - TNWs  Linear Feet:  Width (ft):  TNW Acres
   - Wetlands adjacent to TNWs:  Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: Provide estimates for jurisdictional waters in the review area (check all that apply):
     - Tributary waters  Linear Feet:  Width (Ft).
     - Other non-wetland waters:  Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   Provide estimates of jurisdictional waters within the review area (check all that apply):
   Length (Linear Feet):  Width (feet):  Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW
   Provide acreage estimates for jurisdictional wetland in the review area:  Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
   Provide acreage estimates for jurisdictional wetland in the review area:  Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Feature ID: 292

Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet : width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters linear feet (ft), width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☑ Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.
☑ Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant
  - Office Concurs with data sheets/delineation report
  - Office Does Not Concur with data sheets/delineation report

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD) July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:

Drainage Feature 293

State: AZ  County/Parish/borough: Pinal County  City: N/A

Center coordinates of site: Lat. 32.8482°N  Long. -111.2599"W

Name of nearest waterbody:

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:

Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request

☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date: 

☒ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):

☐ TNWs (new)

☐ Wetlands adjacent to TNWs

☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs

☐ Non-RPWs that flow directly or indirectly into TNWs

☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs

☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs

☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs

☐ Impoundments of jurisdictional waters

☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

<table>
<thead>
<tr>
<th>Non-Wetlands waters</th>
<th>Linear Feet</th>

</tr>
</thead>
</table>

Wetlands Acres:

C. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☒ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW:  
   ☐ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.13058
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   ☐ Tributary flows directly to TNW
   ☑ Tributary flows through 4 tributaries before entering TNW
   Project waters are 30 (or more) river miles from TNW
(b) General Tributary Characteristics

Tributary is: Natural

Tributary properties with respect to top of bank (estimate):
- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Cobbles
- Bedrock
- Sands
- Concrete
- Gravel
- Substrate - Vegetation
- Muck
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Describe Flow Regime: Ephemeral.

Estimate average number of flow events in review area/year: 2-5

Surface Flow is: Discrete and Confined

Subsurface Flow: No

Dye (or other) test performed:

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community

Other (list):

Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - [ ] TNWs Linear Feet: __________ Width (ft): __________ TNW Acres __________
   - [ ] Wetlands adjacent to TNWs: Acres: __________

2. RPWs that flow directly or indirectly into TNWs
   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: __________
   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: __________
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - [ ] Tributary waters Linear Feet: __________ Width (Ft): __________
       - [ ] Other non-wetland waters: Acres: __________

3. Non-RPWs that flow directly or indirectly into TNWs.
   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet): __________ Width (feet): __________ Acres: __________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: __________
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: __________
       - Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C..

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
☐ Other Non-wetland Waters MBR acres:
☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 1616.83 linear feet, 7.61 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☐ Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.
☐ Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature  294

State: AZ  County/Parish/borough: Pinal County  City: N/A
Center coordinates of site: Lat.  32.8482°N  Long.  -111.2599°W

Name of nearest waterbody: 

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: 

Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC):  15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date: 
☒ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters  Linear Feet  Width (ft) and/or Acres
      Wetlands Acres: 

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☒ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW: ____________________________ □ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e., tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.29049
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   □ Tributary flows directly to TNW
   □ Tributary flows through 4 tributaries before entering TNW
   Project waters are 30 (or more) river miles from TNW
**APPROVED JURISDICTIONAL DETERMINATION FORM**

**U.S Army Corps of Engineers**

<table>
<thead>

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

**(b) General Tributary Characteristics**

Tributary is: Natural  
Explain:  

Tributary properties with respect to top of bank (estimate):

- Average Width (ft):  
- Average Depth (ft):  
- Average Side Slopes: 3:1  

Primary tributary substrate composition (check all that apply):

- Silts  
- Sands  
- Concrete  
- Muck  
- Cobble  
- Gravel  
- Substrate - Vegetation  
Other, Explain:  

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.  

Presence of Run/Riffle/Pool Complexes. Explain: Not present.  

Tributary Geometry: Relatively Straight  

Tributary Gradient (approximate average slope): 1%

**(c) Flow**

Tributary Provides for: Ephemeral Flow  

Describe Flow Regime: Ephemeral.  

Estimate average number of flow events in review area/year: 2-5  

Other Information on Duration and Volume:  

Surface Flow is: Discrete and Confined  
Characteristics:  

Subsurface Flow: No  
Explain:  

Dye (or other) test performed:  

Tributary Has (Check all that apply):

- Bed and Banks  
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank  
  - Changes in soil character  
  - Shelving  
  - Vegetation matted down, bent or absent  
  - Leaf litter disturbed or washed away  
  - Sediment deposition  
  - Water staining  
  - Presence of litter and debris  
  - Destruction of terrestrial vegetation  
  - Presence of wrack line  
  - Sediment sorting  
  - Scour  
  - Multiple observed or predicted flow events  
  - Abrupt change in plant community  

Other (list):  

Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- ☐ High tide line indicated by:
- ☐ Mean High water Mark indicated by:
- ☐ oil or scum line along shore objects
- ☐ fine shell or debris deposits (foreshore)
- ☐ physical markings/characteristics
- ☐ tidal gauges
- ☐ other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain:

Identify Specific Pollutants, if known:

(iv) Biological Characteristics. Channel supports (check all that apply):

☐ Riparian Corridor Characteristics:

☐ Wetland Fringe Characteristics:

Habitat for:

☐ Federally Listed Species Explain findings:

☐ Fish/Spawn Areas Explain findings:

☐ Other environmentally -sensitive species Explain findings:

☐ Aquatic/Wildlife diversity Explain:

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

Wetland Size (ac):

Wetland Type, Explain:

Wetland Quality, Explain:

Project Wetlands Cross or Serve as State Boundaries, Explain:

(b) General Flow Relationship with Non-TNW:

Wetland Flow is:

Surface Flow is:

Characteristics:

Subsurface Flow:

Explain Findings:

(c) Wetland Adjacency Determination with Non-TNW:

☐ Wetland Directly Abutting Non-TNW

☐ Wetland Not Directly Abutting Non-TNW

☐ Discrete wetland hydrologic connection Explain:

☐ Ecological connection Explain:

☐ Separated by berm/barrier Explain:

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW:

Project Wetlands: Aerial Miles from TNW:

Flow is From:

Estimate approximate Location of Wetland within Floodplain:
(ii) Chemical Characteristics:
Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain
Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

☐ Riparian Buffer Characteristics (type, average width):
☐ Vegetation type/percent cover. Explain:

Habitat for:
☐ Federally Listed Species Explain:
☐ Fish/Spawn Areas Explain:
☐ Other environmentally-sensitive species Explain:
☐ Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet):  
Acres:  

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus:  See Section III.C.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams):  
length : width (ft):

☐ Other Non-wetland Waters MBR   
acres:

☐ Wetlands MBR   
acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters  
4377.30 linear feet (ft),  
5.99 width (ft)

☐ Other waters  
acres

☐ Wetlands  
acres

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:  Drainage Feature 295

| State:  | AZ |
| County/Parish/borough:  | Pinal County |
| City:  | N/A |

Center coordinates of site:  Lat.  32.8482°N  Long.  -111.2599°W

Name of nearest waterbody:  

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC):  15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g. offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination.  Date:  

☒ Field Determination.  Date(s):  10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICATION

There  Are No  "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There  Are No  "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters  Linear Feet  Width (ft) and/or  Acres

      Wetlands Acres:  

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

   ☒ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain:  Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ___________________________  ☐ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.14703
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         ☐ Tributary flows directly to TNW
         ✔ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Gravel
- Substrate - Vegetation
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.
Presence of Run/Riffle/Pool Complexes. Explain: Not present.
Tributary Geometry: Relatively Straight
Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5
Describe Flow Regime: Ephemeral.
Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:
Subsurface Flow: No Explain:

Dye (or other) test performed:

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community

Other (list):

Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

Surface Flow is: [ ]

Characteristics: [ ]

Subsurface Flow: [ ] Explain Findings: [ ]

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW [ ]
- Wetland Not Directly Abutting Non-TNW [ ]

- Discrete wetland hydrologic connection Explain: [ ]
- Ecological connection Explain: [ ]
- Separated by berm/barrier Explain: [ ]

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: [ ]

Project Wetlands: Aerial Miles from TNW: [ ]

Flow is From: [ ]

Estimate approximate Location of Wetland within Floodplain: [ ]
(ii) Chemical Characteristics:
Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain
Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer  Characteristics (type, average width):
- Vegetation  type/percent cover. Explain:

Habitat for:
- Federally Listed Species  Explain:
- Fish/Spawn Areas  Explain:
- Other environmentally-sensitive species  Explain:
- Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.
Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs  Linear Feet:  Width (ft):  TNW Acres  
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters  Linear Feet:  Width (ft).
       - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

   Provide estimates of jurisdictional waters within the review area (check all that apply):
   - Length (Linear Feet):  Width (feet):  Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW

   Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

   Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet):_ Acres:_

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters
Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- [ ] Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- [ ] Other Non-wetland Waters MBR acres:
- [ ] Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the "Significant Nexus" standard, where such a finding is required for jurisdiction (check all that apply):

- [ ] Non-wetland waters
- [ ] Other waters
- [ ] Wetlands

8. Impoundments of jurisdictional waters.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters
Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- [ ] Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- [ ] Other Non-wetland Waters MBR acres:
- [ ] Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the "Significant Nexus" standard, where such a finding is required for jurisdiction (check all that apply):

- [ ] Non-wetland waters
- [ ] Other waters
- [ ] Wetlands

SECTION IV: DATA SOURCES

Wetlands Acres:

C. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: [ ]
   - □ Vegetation
   - Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   - Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   - (i) General Area Conditions:
     - Watershed Size (sq mi): 4,9650
     - Drainage Area (sq mi): 0.03236
     - Average Annual Rainfall (in): 10
     - Average Annual Snowfall (in): 0
   - (ii) Physical Characteristics:
     - (a) Relationship with TNW
       - □ Tributary flows directly to TNW
       - [ ] Tributary flows through [ ] tributaries before entering TNW
       - Project waters are [30 (or more)] river miles from TNW
| Feature ID: 296 |

Project waters are river Miles from tributary to RPW: 
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: 
Project waters are aerial (straight) miles from tributary to RPW: 
Project waters cross or serve as state boundaries. Explain: 
Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to SectionIII.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

   □ TNWs Linear Feet: ______ Width (ft): ______ TNW Acres ______

   □ Wetlands adjacent to TNWs: Acres: ______

2. RPWs that flow directly or indirectly into TNWs

   □ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: ______

   □ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: ______

   Provide estimates for jurisdictional waters in the review area (check all that apply):

   □ Tributary waters Linear Feet: ______ Width (Ft): ______

   □ Other non-wetland waters: Acres: ______

3. Non-RPWs that flow directly or indirectly into TNWs.

   □ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

   Provide estimates of jurisdictional waters within the review area (check all that apply):

   Length (Linear Feet): ______ Width (feet): ______ Acres: ______

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

   □ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

   □ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: ______

   □ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: ______

   Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   □ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

   Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
☐ Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): ______ Acres: ______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: ______ width (ft): ______
☐ Other Non-wetland Waters MBR acres: ______
☐ Wetlands MBR acres: ______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters 385.36 linear feet (ft), 4.40 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

SECTION II: SUMMARY OF FINDINGS
A. RHA SECTION 10 DETERMINATION OF JURISDICTION
   There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.
   ☐ Waters subject to the ebb and flow of the tide.
   ☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION
   There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.
   1. Waters of the U.S.
      a. Indicate presence of water of U.S. in review area (Check all the apply):
         ☐ TNWs (new)
         ☐ Wetlands adjacent to TNWs
         ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
         ☐ Non-RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
         ☐ Impoundments of jurisdictional waters
         ☐ Isolated (interstate or intrastate) waters, including isolated wetlands
      b. Identify (estimate) size of waters of the U.S. in the review area
         Non-Wetlands waters Linear Feet Width (ft) and/or Acres
         Wetlands Acres:
      c. Limits (boundaries) of Jurisdiction based on:
   2. Non-Regulated Waters/Wetlands (check if applicable):
      ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: [ ]
   - Vegetation: [ ]
   - Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   - Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e., tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   - **(i) General Area Conditions:**
     - Watershed Size (sq mi): 49650
     - Drainage Area (sq mi): 0.02485
     - Average Annual Rainfall (in): 10
     - Average Annual Snowfall (in): 0
   - **(ii) Physical Characteristics:**
     - **(a) Relationship with TNW**
       - [ ] Tributary flows directly to TNW
       - [✓] Tributary flows through [4] tributaries before entering TNW
       - Project waters are [30 (or more)] river miles from TNW
**Feature ID:** 297

**U.S Army Corps of Engineers**

Project waters are river Miles from tributary to RPW:

Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:

Project waters are aerial (straight) miles from tributary to RPW:

Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

### (b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):

- **Average Width (ft):**
- **Average Depth (ft):**
- **Average Side Slopes:** 3:1

Primary tributary substrate composition (check all that apply):

- Silts

3. Characteristics of all wetlands adjacent to the tributary (if any)
All wetland(s) being considered in cumulative analysis:
Wetland acres in total being considered in cumulative analysis:
Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D.

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

<table>
<thead>
<tr>

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

  Provide estimates for jurisdictional waters in the review area (check all that apply):

  - Tributary waters: Linear Feet: Width (Ft).
  - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

   Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.

   Provide estimates of jurisdictional waters within the review area (check all that apply):

   Length (Linear Feet): Width (ft): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW

     Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

   Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters linear feet (ft), width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD) July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 298
   State: AZ County/Parish/borough: Pinal County City: N/A
   Center coordinates of site: Lat. 32.8482°N Long. -111.2599°W
   Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam
   Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: Gila River between Powers Butte and Gillespie Dam
   Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)
   □ Office (Desk) Determination. Date: 
   ☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION
   There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.
   □ Waters subject to the ebb and flow of the tide.
   □ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION
   There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.
   1. Waters of the U.S.
      a. Indicate presence of water of U.S. in review area (Check all the apply):
         □ TNWs (new)
         □ Wetlands adjacent to TNWs
         □ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
         □ Non-RPWs that flow directly or indirectly into TNWs
         □ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
         □ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
         □ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
         □ Impoundments of jurisdictional waters
         □ Isolated (interstate or intrastate) waters, including isolated wetlands
      b. Identify (estimate) size of waters of the U.S. in the review area
         Non-Wetlands waters Linear Feet Width (ft) and/or Acres
         Wetlands Acres:
      c. Limits (boundaries) of Jurisdiction based on:
   2. Non-Regulated Waters/Wetlands (check if applicable):
      ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
         Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ___________________   ☐ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi):  49650
      Drainage Area (sq mi):  0.00206
      Average Annual Rainfall (in):  10
      Average Annual Snowfall (in):  0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         ☐ Tributary flows directly to TNW  
         ☑ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:  
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:  
Project waters are aerial (straight) miles from tributary to RPW:  
Project waters cross or serve as state boundaries. Explain:  

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

### (b) General Tributary Characteristics

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- [ ] TNWs
- [ ] Wetlands adjacent to TNWs

   Linear Feet: Width (ft): TNW Acres

2. RPWs that flow directly or indirectly into TNWs

- [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

- [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

   Provide estimates for jurisdictional waters in the review area (check all that apply):

   - [ ] Tributary waters
   - [ ] Other non-wetland waters

   Linear Feet: Width (ft):

3. Non-RPWs that flow directly or indirectly into TNWs.

   [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

   Provide estimates of jurisdictional waters within the review area (check all that apply):

   Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

   - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

   - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW

   Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

   Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): Length (linear feet) Acres:
☐ Other Non-wetland Waters MBR
☐ Wetlands MBR

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters
☐ Other waters
☐ Wetlands

SECTIONS: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☐ Office (Desk) Determination. Date:  
☑ Field Determination. Date(s): 10/2012

**SECTION II: SUMMARY OF FINDINGS**

A. RHA SECTION 10 DETERMINATION OF JURISDICTION  
There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION  
There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.  
   a. Indicate presence of water of U.S. in review area (Check all the apply):  
      ☐ TNWs (new)  
      ☐ Wetlands adjacent to TNWs  
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
      ☐ Non-RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
      ☐ Impoundments of jurisdictional waters  
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area  
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres  
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:  

2. Non-Regulated Waters/Wetlands (check if applicable):  
☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:  
   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

   Identify TNW:
   ☐ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
   - Watershed Size (sq mi): 49650
   - Drainage Area (sq mi): 0.09681
   - Average Annual Rainfall (in): 10
   - Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

       (a) Relationship with TNW

       ☐ Tributary flows directly to TNW
       ☑ Tributary flows through 4 tributaries before entering TNW

       Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW: 
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: 
Project waters are aerial (straight) miles from tributary to RPW: 
Project waters cross or serve as state boundaries. Explain: 

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain: 

Tributary properties with respect to top of bank (estimate):
- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):

3. Characteristics of all wetlands adjacent to the tributary (if any)
All wetland(s) being considered in cumulative analysis:
Wetland acres in total being considered in cumulative analysis:
Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION
A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.
Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:
This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

### D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. **TNWs and Adjacent Wetlands.** Check all that apply and provide size estimates in review area:

   - TNWs: Linear Feet: __________ Width (ft): __________ TNW Acres __________
   - Wetlands adjacent to TNWs: Acres: __________

2. **RPWs that flow directly or indirectly into TNWs**

   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: __________
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: __________
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters: Linear Feet: __________ Width (Ft): __________
       - Other non-wetland waters: Acres: __________

3. **Non-RPWs that flow directly or indirectly into TNWs.**

   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet): __________ Width (feet): __________ Acres: __________

4. **Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.**

   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: __________
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: __________
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

5. **Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW**

   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

6. **Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters
- Wetlands

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters linear feet (ft), width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD) July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 3

State: AZ  County/Parish/borough: Pinal County  City: N/A

Center coordinates of site: Lat. 32.8482°N  Long. -111.2599°W

Name of nearest waterbody:

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date: 
☒ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):
☐ TNWs (new)
☐ Wetlands adjacent to TNWs
☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
☐ Non-RPWs that flow directly or indirectly into TNWs
☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
☐ Impoundments of jurisdictional waters
☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

Non-Wetlands waters Linear Feet Width (ft) and/or Acres

Wetlands Acres:

c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☒ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: 
   - Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   - Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   - **(i) General Area Conditions:**
     - Watershed Size (sq mi): 49650
     - Drainage Area (sq mi): 0.04051
     - Average Annual Rainfall (in): 10
     - Average Annual Snowfall (in): 0
   - **(ii) Physical Characteristics:**
     - Relationship with TNW
       - ☑ Tributary flows directly to TNW
       - ☐ Tributary flows through [4] tributaries before entering TNW
       - Project waters are [30 (or more)] river miles from TNW
(b) General Tributary Characteristics

Tributary is: Natural

Tributary properties with respect to top of bank (estimate):
- Average Width (ft): [ ]
- Average Depth (ft): [ ]
- Average Side Slopes: [ ]

Primary tributary substrate composition (check all that apply):
- Silts [ ]

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):
Explain: [ ]
Identify Specific Pollutants, if known: [ ]

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: [ ]
- Wetland Fringe Characteristics: [ ]

Habitat for:

- Federally Listed Species Explain findings: [ ]
- Fish/Spawn Areas Explain findings: [ ]
- Other environmentally sensitive species Explain findings: [ ]
- Aquatic/Wildlife diversity Explain: [ ]

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics
Properties:
- Wetland Size (ac): [ ]
- Wetland Type, Explain: [ ]
- Wetland Quality, Explain: [ ]

Project Wetlands Cross or Serve as State Boundaries, Explain: [ ]

(b) General Flow Relationship with Non-TNW:
- Wetland Flow is: Explain: [ ]
- Surface Flow is: [ ]

Characteristics: [ ]

Subsurface Flow: [ ]
Explain Findings: [ ]

(c) Wetland Adjacency Determination with Non-TNW:
- Wetland Not Directly Abutting Non-TNW [ ]
  - Discrete wetland hydrologic connection Explain: [ ]
  - Ecological connection Explain: [ ]
  - Separated by berm/barrier Explain: [ ]
- Wetland Directly Abutting Non-TNW [ ]

(d) Proximity (Relationship) to TNW
- Project Wetlands: River Miles from TNW: [ ]
- Project Wetlands: Aerial Miles from TNW: [ ]

Flow is From: [ ]
Estimate approximate Location of Wetland within Floodplain: [ ]
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer Characteristics (type, average width):
- Vegetation type/percent cover. Explain:
- Habitat for:
  - Federally Listed Species Explain:
  - Fish/Spawn Areas Explain:
  - Other environmentally-sensitive species Explain:
  - Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis: 

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:  Drainage Feature 30

State: AZ  
County/Parish/borough: Pinal  
City: N/A

Center coordinates of site: Lat. 32.8482°N  
Long. -111.2599°W

Name of nearest waterbody:  
Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:  
☐ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all that apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters ___________ Linear Feet  
      Width (ft) and/or ___________ Acres
      Wetlands Acres: ___________

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: [ ] Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.10002
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         [ ] Tributary flows directly to TNW
         [ ] Tributary flows through [ ] tributaries before entering TNW
         Project waters are [ ] river miles from TNW
         [ ] 30 (or more)
<table>
<thead>
<tr>

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis: 

Wetland acres in total being considered in cumulative analysis: 

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below:

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

<table>
<thead>
<tr>
<th></th>
<th>TNWs</th>
<th>Linear Feet:</th>
<th>Width (ft):</th>
<th>TNW Acres</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Wetlands adjacent to TNWs:</td>
<td>Acres:</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and rationale indicating that tributary is perennial:

- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

  Provide estimates for jurisdictional waters in the review area (check all that apply):

  - Tributary waters: | Linear Feet: | Width (ft): |
  - Other non-wetland waters: | Acres: |

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.

  Provide estimates of jurisdictional waters within the review area (check all that apply):

  | Length (Linear Feet): | Width (feet): | Acres: |

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.B, above. Provide rationale indicating that wetland is directly abutting and RPW:

  Provide acreage estimates for jurisdictional wetland in the review area: | Acres: |

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

  Provide acreage estimates for jurisdictional wetland in the review area: | Acres: |

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Feature ID: 30

Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams) linear feet:
- Other Non-wetland Waters MBR:
- Wetlands MBR:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters:
- Other waters:
- Wetlands:

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

   ✓ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
   ☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)
   ☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS
A. RHA SECTION 10 DETERMINATION OF JURISDICTION
   There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.
   ☐ Waters subject to the ebb and flow of the tide.
   ☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION
   There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.
   1. Waters of the U.S.
      a. Indicate presence of water of U.S. in review area (Check all the apply):
         ☐ TNWs (new)
         ☐ Wetlands adjacent to TNWs
         ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
         ☐ Non-RPWS that flow directly or indirectly into TNWs
         ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands adjacent to non-RPWS that flow directly or indirectly into TNWs
         ☐ Impoundments of jurisdictional waters
         ☐ Isolated (interstate or intrastate) waters, including isolated wetlands
   
   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ✓ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: [ ] Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.00601
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   □ Tributary flows directly to TNW
   ✔ Tributary flows through [x] tributaries before entering TNW
   Project waters are [30 (or more)] river miles from TNW
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all of its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands.  Check all that apply and provide size estimates in review area:

   - [ ] TNWs Linear Feet: __________ Width (ft): _______ TNW Acres ________
   - [ ] Wetlands adjacent to TNWs: Acres: ________

2. RPWs that flow directly or indirectly into TNWs

   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdicational. Provide data and Rationale indicating that tributary is perennial: ________
   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdicational. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: ________
     Provide estimates for jurisdicational waters in the review area (check all that apply):
     - [ ] Tributary waters Linear Feet: _______ Width (Ft): _______
     - [ ] Other non-wetland waters: Acres: _______

3. Non-RPWs that flow directly or indirectly into TNWs.

   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdicational. Data supporting this conclusion provided at section III.c. Provide estimates of jurisdicational waters within the review area (check all that apply):
     Length (Linear Feet): _______ Width (feet): _______ Acres: _______

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

   - [ ] Wetlands directly abut RPW and thus are jurisdicational as adjacent wetlands.
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: ________
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
     Provide acreage estimates for jurisdicational wetland in the review area: Acres: _______

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdicational. Data supporting this conclusion is provided at Section III.C. Provide acreage estimates for jurisdicational wetland in the review area: Acres: _______

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: 

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): 
Acres: 

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters 

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft): 
☐ Other Non-wetland Waters MBR acres: 
☐ Wetlands MBR acres: 

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 
☐ Other waters 
☐ Wetlands 

EXPLAIN FINDING OF NO SIGNIFICANT Nexus:

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION
A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:  Drainage Feature  301

State:  AZ  County/Parish/borough:  Pinal County  City:  N/A

Center coordinates of site:  Lat.  32.8482°N  Long.  -111.2599°W

Name of nearest waterbody:  

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC):  15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)
☐ Office (Desk) Determination.  Date:  
☒ Field Determination.  Date(s):  10/2012

SECTION II: SUMMARY OF FINDINGS
A. RHA SECTION 10 DETERMINATION OF JURISDICTION
There Are No navigable waters of the U.S. within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329 in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION
There Are No waters of the U.S. within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
   ☐ TNWs (new)
   ☐ Wetlands adjacent to TNWs
   ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
   ☐ Non-RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
   ☐ Impoundments of jurisdictional waters
   ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
   Non-Wetlands waters  Linear Feet  Width (ft) and/or  Acres
   Wetlands Acres:  

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
☒ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: 
   - ☐ Vegetation
   - Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   - Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   - (i) General Area Conditions:
     - Watershed Size (sq mi): 49650
     - Drainage Area (sq mi): 0.00306
     - Average Annual Rainfall (in): 10
     - Average Annual Snowfall (in): 0
   - (ii) Physical Characteristics:
     - ☐ Tributary flows directly to TNW
     - ☑ Tributary flows through 4 tributaries before entering TNW
     - Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics
Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
Average Width (ft):
Average Depth (ft):
Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
☐ Silts ☐ Sands ☐ Concrete ☐ Muck
☐ Cobble ☐ Gravel ☐ Substrate - Vegetation ☐ Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:
Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:
Subsurface Flow: No Explain:
☐ Dye (or other) test performed:

Tributary Has (Check all that apply):
☐ Bed and Banks
☐ OHWM (check all the apply): OHWM Indicators:
☐ Clear, natural line impressed on the bank Presence of litter and debris
☐ Changes in soil character Destruction of terrestrial vegetation
☐ Shelving Presence of wrack line
☐ Vegetation matted down, bent or absent Sediment sorting
☐ Leaf litter disturbed or washed away Scour
☐ Sediment deposition Multiple observed or predicted flow events
☐ Water staining Abrupt change in plant community
Other (list):

☐ Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: [ ]
- Mean High water Mark indicated by: [ ]
- oil or scum line along shore objects
- fine shell or debris deposits (foreshore)
- physical markings/characteristics
- tidal gauges
- other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain:

Identify Specific Pollutants, if known:

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics:
- Wetland Fringe Characteristics:

Habitat for:

- Federally Listed Species Explain findings:
- Fish/Spawn Areas Explain findings:
- Other environmentally -sensitive species Explain findings:
- Aquatic/Wildlife diversity Explain:

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:
- Wetland Size (ac):
- Wetland Type, Explain:
- Wetland Quality, Explain:

Project Wetlands Cross or Serve as State Boundaries, Explain:

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: Explain:

Surface Flow is:

Characteristics:

Subsurface Flow: Explain Findings:

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW
  - Discrete wetland hydrologic connection Explain:
  - Ecological connection Explain:
  - Separated by berm/barrier Explain:

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW:

Project Wetlands: Aerial Miles from TNW:

Flow is From:

Estimate approximate Location of Wetland within Floodplain:
(ii) Chemical Characteristics:
Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain
Identify specific pollutants, if known:

(iii) Biological Characteristics. Wetland supports (check all that apply):

☐ Riparian Buffer  Characteristics (type, average width):

☐ Vegetation  type/percent cover. Explain:

Habitat for:

☐ Federally Listed Species  Explain:

☐ Fish/Spawn Areas  Explain:

☐ Other environmentally-sensitive species  Explain:

☐ Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

* Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
* Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
* Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
* Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented here.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

<table>
<thead>
<tr>
<th>Wetland Type</th>
<th>Linear Feet</th>
<th>Width (ft)</th>
<th>TNW Acres</th>
</tr>
</thead>
<tbody>
<tr>
<td>TNWs</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Wetlands adjacent to TNWs</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: 

- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: 

  Provide estimates for jurisdictional waters in the review area (check all that apply):

<table>
<thead>
<tr>
<th>Tributary waters</th>
<th>Linear Feet</th>
<th>Width (ft)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Other non-wetland waters</td>
<td>Acres</td>
<td></td>
</tr>
</tbody>
</table>

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.

  Provide estimates of jurisdictional waters within the review area (check all that apply):

<table>
<thead>
<tr>
<th>Length (Linear Feet)</th>
<th>Width (feet)</th>
<th>Acres</th>
</tr>
</thead>
</table>

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

  Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

  Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:

  Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

  Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section III.C.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):

☐ Other Non-wetland Waters MBR acres:

☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters 286.98 linear feet (ft), 4.85 width (ft)

☑ Other waters acres

☑ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)  
☐ Office (Desk) Determination. Date:  
☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION  
There ☐ Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.  
☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION  
There ☐ Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):  
      ☐ TNWs (new)  
      ☐ Wetlands adjacent to TNWs  
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
      ☐ Non-RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
      ☐ Impoundments of jurisdictional waters  
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area  
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres  
      Wetlands Acres:  

   c. Limits (boundaries) of Jurisdiction based on:  

2. Non-Regulated Waters/Wetlands (check if applicable):  
☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:  
   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

   Identify TNW: ___________________________ □ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.02416
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

      (a) Relationship with TNW

         □ Tributary flows directly to TNW
         ✔ Tributary flows through 4 tributaries before entering TNW

         Project waters are 30 (or more) river miles from TNW
## (b) General Tributary Characteristics

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis: 

Wetland acres in total being considered in cumulative analysis: 

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

**D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)**

1. **TNWs and Adjacent Wetlands.** Check all that apply and provide size estimates in review area:

   - **TNWs**  
     - Linear Feet: [ ] Width (ft): [ ] TNW Acres [ ]
   - **Wetlands adjacent to TNWs:** Acres: [ ]

2. **RPWs that flow directly or indirectly into TNWs**
   - **Tributaries of TNWs where tributaries typically flow year-round are jurisdictional.** Provide data and Rationale indicating that tributary is perennial: [ ]
   - **Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional.** Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: [ ]
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - **Tributary waters** Linear Feet: [ ] Width (Ft): [ ]
       - **Other non-wetland waters** Acres: [ ]

3. **Non-RPWs that flow directly or indirectly into TNWs.**
   - **Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional.** Data supporting this conclusion provided at section III.c.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet): [ ] Width (feet): [ ] Acres: [ ]

4. **Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.**
   - **Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.**
     - **Wetlands directly abutting an RPW where tributaries typically flow year-round.** Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: [ ]
     - **Wetlands directly abutting an RPW where tributaries typically flow "Seasonally".** Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: [ ]
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: [ ]

5. **Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW**
   - **Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional.** Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: [ ]

6. **Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.**
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres): __________

7. Impoundments of jurisdictional waters.
   Demonstration of Jurisdiction: __________

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale: __________
Length (linear feet): __________  Acres: __________

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters __________
Explain finding of no Significant Nexus: See Section III.C.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: __________ width (ft): __________
☐ Other Non-wetland Waters MBR acres: __________
☐ Wetlands MBR acres: __________

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 521.92 linear feet (ft), 3.86 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

Additional Comments to Support JD:
Approved Jurisdictional Determination Form

U.S. Army Corps of Engineers

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

Section I: Background Information

A. Report Completion Date for Approved Jurisdictional Determination (JD) July 5, 2013

B. District Office, File Name, and Number

Los Angeles District, File No. Pending

C. Project Location and Background Information: Drainage Feature 303

State: AZ

County/Parish/borough: Pinal County

City: N/A

Center coordinates of site: Lat. 32.8482°N Long. -111.2599°W

Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request

☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

Section II: Summary of Findings

A. RHA Section 10 Determination of Jurisdiction

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA Section 404 Determination of Jurisdiction

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters Linear Feet Width (ft) and/or Acres

      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: _________________________  □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.00120
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         □ Tributary flows directly to TNW
         ✔ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural
Explain:

Tributary properties with respect to top of bank (estimate):
Average Width (ft):
Average Depth (ft):
Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Cobble

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

   Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

   This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs Linear Feet: Width (ft): TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review are (check all that apply):
       - Tributary waters Linear Feet: Width (Ft).
       - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
   - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
☐ Other Non-wetland Waters MBR acres:
☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 257.30 linear feet (ft), 3.37 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

☐ Office (Desk) Determination. Date:  
☐ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
   ☐ TNWs (new)
   ☐ Wetlands adjacent to TNWs
   ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
   ☐ Non-RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
   ☐ Impoundments of jurisdictional waters
   ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☐ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________________ ☐ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary, that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.45986
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
   (a) Relationship with TNW
   ☐ Tributary flows directly to TNW
   ☑ Tributary flows through 4 tributaries before entering TNW
   Project waters are 30 (or more) river miles from TNW
(b) General Tributary Characteristics

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g., between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- [ ] TNWs Linear Feet: [ ] Width (ft): [ ] TNW Acres [ ]
- [ ] Wetlands adjacent to TNWs: Acres: [ ]

2. RPWs that flow directly or indirectly into TNWs

- [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: [ ]
- [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: [ ]

Provide estimates for jurisdictional waters in the review area (check all that apply):

- [ ] Tributary waters Linear Feet: [ ] Width (ft): [ ]
- [ ] Other non-wetland waters: Acres: [ ]

3. Non-RPWs that flow directly or indirectly into TNWs.

- [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

Provide estimates of jurisdictional waters within the review area (check all that apply):

- [ ] Length (Linear Feet): [ ] Width (feet): [ ] Acres: [ ]

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

       - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: [ ]

       - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: [ ]

Provide acreage estimates for jurisdictional wetland in the review area: Acres: [ ]

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetland in the review area: Acres: [ ]

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Feature ID: 304

Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C..

Provide estimates for jurisdictional wetland in the review area (in acres): 

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: 

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale: 
Length (linear feet): Acres: 

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters 

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft): 
- Other Non-wetland Waters MBR acres: 
- Wetlands MBR acres: 

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters linear feet (ft), width (ft) 
- Other waters acres 
- Wetlands acres 

SECTION IV: DATA SOURCES

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S. within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S. within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):

☐ TNWs (new)
☐ Wetlands adjacent to TNWs
☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
☐ Non-RPWS that flow directly or indirectly into TNWs
☐ Wetlands directly abutting RPWS that flow directly or indirectly into TNWs
☐ Wetlands adjacent to but not directly abutting RPWS that flow directly or indirectly into TNWs
☐ Wetlands adjacent to non-RPWS that flow directly or indirectly into TNWs
☐ Impoundments of jurisdictional waters
☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

Non-Wetlands waters  Linear Feet  Width (ft) and/or  Acres

Wetlands Acres: 

c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: 
   - ☐ Vegetation
   - Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   - Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

A wetland that is adjacent to but that does not directly abut an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   - **(i) General Area Conditions:**
     - Watershed Size (sq mi): 49650
     - Drainage Area (sq mi): 0.00452
     - Average Annual Rainfall (in): 10
     - Average Annual Snowfall (in): 0
   - **(ii) Physical Characteristics:**
     - ☐ Tributary flows directly to TNW
     - ☑ Tributary flows through 4 tributaries before entering TNW
     - Project waters are 30 (or more) river miles from TNW
Project waters are

River Miles from tributary to RPW:

Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:

Project waters are

  - □ Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs Linear Feet: Width (ft): TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: Width (Ft).
       - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
   - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): ___________  Acres: ___________

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: ___________  width (ft): ___________

☐ Other Non-wetland Waters MBR acres: ___________

☐ Wetlands MBR acres: ___________

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 168.83 linear feet (ft), 4.11 width (ft)

☐ Other waters acres

☐ Wetlands acres

SECTION IV: DATA SOURCES

SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   - Identify TNW: [ ]
   - [ ] Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
      - Watershed Size (sq mi): 49650
      - Drainage Area (sq mi): 0.46645

 All wetland(s) being considered in cumulative analysis:

 Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs Linear Feet: [ ] Width (ft): [ ] TNW Acres [ ]
   - Wetlands adjacent to TNWs: Acres [ ]

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: [ ] Width (ft): [ ]
       - Other non-wetland waters: Acres [ ]

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet):  
Acres:  

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus:  See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet:  width (ft):  
- Other Non-wetland Waters MBR acres:  
- Wetlands MBR acres:  

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters  linear feet (ft),  width (ft)  
- Other waters acres  
- Wetlands acres  

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 307  
   State: AZ  
   County/Parish/borough: Pinal  
   City: N/A  
   Center coordinates of site: Lat. 32.8482°N  Long. -111.2599°W

   Name of nearest waterbody:  
   Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: Gila River between Powers Butte and Gillespie Dam

   Name of watershed or Hydrologic Unit Code (HUC): 15050100

   ☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request  
   ☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)  
   ☐ Office (Desk) Determination. Date:  
   ☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION
There  Are No  "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

   ☐ Waters subject to the ebb and flow of the tide.  
   ☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION
There  Are No  "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

   1. Waters of the U.S.
      a. Indicate presence of water of U.S. in review area (Check all the apply):
         ☐ TNWs (new)  
         ☑ Wetlands adjacent to TNWs
         ☑ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
         ☐ Non-RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
         ☐ Impoundments of jurisdictional waters
         ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

      b. Identify (estimate) size of waters of the U.S. in the review area
         Non-Wetlands waters [________] Linear Feet [________] Width (ft) and/or [________] Acres  
         Wetlands Acres: [________]

   c. Limits (boundaries) of Jurisdiction based on:  

   2. Non-Regulated Waters/Wetlands (check if applicable):
      ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW: ____________ □ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

(i) General Area Conditions:

<table>
<thead>
<tr>
<th>Watershed Size (sq mi):</th>
<th>49650</th>
</tr>
</thead>
<tbody>
<tr>
<td>Drainage Area (sq mi):</td>
<td>0.00186</td>
</tr>
<tr>
<td>Average Annual Rainfall (in):</td>
<td>10</td>
</tr>
<tr>
<td>Average Annual Snowfall (in):</td>
<td>0</td>
</tr>
</tbody>
</table>

(ii) Physical Characteristics:

(a) Relationship with TNW

☐ Tributary flows directly to TNW
☑ Tributary flows through _______ tributaries before entering TNW

Project waters are _______ (or more) river miles from TNW
The document contains a form titled "APPROVED JURISDICTIONAL DETERMINATION FORM" from the U.S. Army Corps of Engineers. The form includes various sections for data entry and explanation, such as:

- **Project waters are**
  - river
  - Miles from tributary to RPW:
  - aerial (straight) miles from tributary to TNW:
  - aerial (straight) miles from tributary to RPW:
- **Project waters cross or serve as state boundaries.**
  - Explain:
- **Identify flow route to TNW**
  - Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

### (b) General Tributary Characteristics
- **Tributary is:**
  - Natural
  - Explain:
- **Tributary properties with respect to top of bank (estimate):**
  - Average Width (ft):
  - Average Depth (ft):
  - Average Side Slopes: 3:1
- **Primary tributary substrate composition (check all that apply):**
  - Silts
  - Sands
  - Concrete
  - Muck
  - Cobble
  - Gravel
  - Substrate - Vegetation
  - Other, Explain:
- **Tributary Condition/Stability** [e.g., highly eroding, sloughing banks. Explain:]
  - Stable.
- **Presence of Run/Riffle/Pool Complexes.**
  - Not present.
- **Tributary Geometry:**
  - Relatively Straight
- **Tributary Gradient (approximate average slope):**
  - 1%

### (c) Flow
- **Tributary Provides for:**
  - Ephemeral Flow
- **Estimate average number of flow events in review area/year:**
  - 2-5
- **Describe Flow Regime:**
  - Ephemeral.
- **Other Information on Duration and Volume:**
- **Surface Flow is:**
  - Discrete and Confined
  - Characteristics:
- **Subsurface Flow:**
  - No
  - Explain:
- **Dye (or other) test performed:**

**Tributary Has** (Check all that apply):
- Bed and Banks
- **OHWM (check all the apply):**
  - OHWM Indicators:
    - Clear, natural line impressed on the bank
    - Changes in soil character
    - Shelving
    - Vegetation matted down, bent or absent
    - Leaf litter disturbed or washed away
    - Sediment deposition
    - Water staining
    - Presence of litter and debris
    - Destruction of terrestrial vegetation
    - Presence of wrack line
    - Sediment sorting
    - Scour
    - Multiple observed or predicted flow events
    - Abrupt change in plant community
- **Discontinuous?**
  - Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- [ ] High tide line indicated by: ____________________________
- [ ] Mean High water Mark indicated by: ____________________________
- [ ] oil or scum line along shore objects
- [ ] fine shell or debris deposits (foreshore)
- [ ] physical markings/characteristics
- [ ] tidal gauges
- [ ] other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: __________________________________________________________

Identify Specific Pollutants, if known: __________________________________

(iv) Biological Characteristics. Channel supports (check all that apply):

- [ ] Riparian Corridor Characteristics: ____________________________
- [ ] Wetland Fringe Characteristics: ____________________________

Habitat for:

- [ ] Federally Listed Species Explain findings: ____________________________
- [ ] Fish/Spawn Areas Explain findings: ____________________________
- [ ] Other environmentally-sensitive species Explain findings: ____________________________
- [ ] Aquatic/Wildlife diversity Explain: ____________________________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

Wetland Size (ac): ____________________________
Wetland Type, Explain: ____________________________
Wetland Quality, Explain: ____________________________

Project Wetlands Cross or Serve as State Boundaries, Explain: ____________________________

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: ____________________________ Explain: ____________________________
Surface Flow is: ____________________________

Characteristics: ____________________________
Subsurface Flow: ____________________________ Explain Findings: ____________________________

(c) Wetland Adjacency Determination with Non-TNW:

- [ ] Wetland Directly Abutting Non-TNW
- [ ] Wetland Not Directly Abutting Non-TNW

- [ ] Discrete wetland hydrologic connection Explain: ____________________________
- [ ] Ecological connection Explain: ____________________________
- [ ] Separated by berm/barrier Explain: ____________________________

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: ____________________________
Project Wetlands: Aerial Miles from TNW: ____________________________

Flow is From: ____________________________

Estimate approximate Location of Wetland within Floodplain: ____________________________
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

☐ Riparian Buffer Characteristics (type, average width):

☐ Vegetation type/percent cover. Explain:

Habitat for:

☐ Federally Listed Species Explain:

☐ Fish/Spawn Areas Explain:

☐ Other environmentally-sensitive species Explain:

☐ Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - [ ] TNWs Linear Feet: ______ Width (ft): ______ TNW Acres ______
   - [ ] Wetlands adjacent to TNWs: Acres: ______

2. RPWs that flow directly or indirectly into TNWs
   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: ______
   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: ______
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - [ ] Tributary waters Linear Feet: ______ Width (Ft): ______
       - [ ] Other non-wetland waters: Acres: ______

3. Non-RPWs that flow directly or indirectly into TNWs.
   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet): ______ Width (feet): ______ Acres: ______

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: ______
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: ______
       - Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- [ ] Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- [ ] Other Non-wetland Waters MBR acres:
- [ ] Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- [x] Non-wetland waters linear feet (ft), acres
- [ ] Other waters acres
- [ ] Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION  
There Are No "navigable waters of the U.S. within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329 in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION  
There Are No "waters of the U.S. within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.  
   a. Indicate presence of water of U.S. in review area (Check all the apply):  
      ☐ TNWs (new)  
      ☐ Wetlands adjacent to TNWs  
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
      ☐ Non-RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
      ☐ Impoundments of jurisdictional waters  
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area  
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres  
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:  

2. Non-Regulated Waters/Wetlands (check if applicable):  
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: [Blank] □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.01996
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         □ Tributary flows directly to TNW
         ☑ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
(b) General Tributary Characteristics

Tributary is: Natural

Tributary properties with respect to top of bank (estimate):
- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Gravel
- Substrate - Vegetation
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain]: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined

Subsurface Flow: No

Dye (or other) test performed:

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining

Other (list):

Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

   Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

   This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- TNWs
- Linear Feet: Width (ft): TNW Acres
- Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
  - Provide estimates for jurisdictional waters in the review area (check all that apply):
    - Tributary waters Linear Feet: Width (Ft).
    - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.
  - Provide estimates of jurisdictional waters within the review area (check all that apply):
    - Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
308

Feature ID: 308

U.S Army Corps of Engineers

Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): _______ Acres: _______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section III.C.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: _______ width (ft): _______

☐ Other Non-wetland Waters MBR acres: _______

☐ Wetlands MBR acres: _______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 213.28 linear feet (ft), 5.12 width (ft)

☐ Other waters acres

☐ Wetlands acres

☐ Office (Desk) Determination. Date:

☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters  
      Linear Feet  
      Width (ft) and/or  
      Acres

      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
Identify TNW: ____________________________ ☐ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   - Watershed Size (sq mi): 49650
   - Drainage Area (sq mi): 0.00904
   - Average Annual Rainfall (in): 10
   - Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

      (a) Relationship with TNW

      ☐ Tributary flows directly to TNW

      ☑ Tributary flows through _______ tributaries before entering TNW

      Project waters are _______ (or more) river miles from TNW
Project waters are river Miles from tributary to RPW: 
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: 
Project waters are aerial (straight) miles from tributary to RPW: 
Project waters cross or serve as state boundaries. Explain: 
Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics
Tributary is: Natural Explain: 
Tributary properties with respect to top of bank (estimate):
- Average Width (ft): 
- Average Depth (ft): 
- Average Side Slopes: 3:1
Primary tributary substrate composition (check all that apply):
- Silts 
- Sands 
- Concrete 
- Muck 
- Cobbles 
- Gravel 
- Substrate - Vegetation 
- Other, Explain: 
Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.
Presence of Run/Riffle/Pool Complexes. Explain: Not present.
Tributary Geometry: Relatively Straight
Tributary Gradient (approximate average slope): 1%

(c) Flow:
Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5
Describe Flow Regime: Ephemeral.
Other Information on Duration and Volume:
Surface Flow is: Discrete and Confined Characteristics: 
Subsurface Flow: No Explain: 
☐ Dye (or other) test performed: 
Tributary Has (Check all that apply):
☐ Bed and Banks
☐ OHWM (check all the apply): OHWM Indicators:
- Clear, natural line impressed on the bank
- Changes in soil character
- Shelving
- Vegetation matted down, bent or absent
- Leaf litter disturbed or washed away
- Sediment deposition
- Water staining
- Presence of litter and debris
- Destruction of terrestrial vegetation
- Presence of wrack line
- Sediment sorting
- Scour
- Multiple observed or predicted flow events
- Abrupt change in plant community
Other (list): 
☐ Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: __________________________
- Mean High water Mark indicated by: __________________
- Oil or scum line along shore objects __________________
- Fine shell or debris deposits (foreshore) _______________
- Physical markings/characteristics _____________________
- Tidal gauges ______________________________________
- Other ___________________________________________

(iii) Chemical Characteristics:

Charaterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: __________________________________________

Identify Specific Pollutants, if known: __________________

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: ____________________
- Wetland Fringe Characteristics: _______________________

Habitat for:

- Federally Listed Species Explain findings: ____________
- Fish/Spawn Areas Explain findings: ___________________
- Other environmentally sensitive species Explain findings:
- Aquatic/Wildlife diversity Explain: ____________________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac): __________________
- Wetland Type, Explain: __________________
- Wetland Quality, Explain: _______________

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: ___________________ Explain: __________

Surface Flow is: ____________________

Characteristics: ____________________

Subsurface Flow: ____________________ Explain Findings: __________

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW

Discrete wetland hydrologic connection Explain: __________

Ecological connection Explain: _______________________

Separated by berm/barrier Explain: ___________________

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: _______________

Project Wetlands: Aerial Miles from TNW: _______________

Flow is From: ________________________________

Estimate approximate Location of Wetland within Floodplain: ____________________
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer Characteristics (type, average width):
- Vegetation type/percent cover. Explain:

Habitat for:
- Federally Listed Species Explain:
- Fish/Spawn Areas Explain:
- Other environmentally-sensitive species Explain:
- Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs
   - Wetlands adjacent to TNWs:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters
       - Other non-wetland waters:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet):
     - Width (feet):
     - Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
   - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
   - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Provide acreage estimates for jurisdictional wetland in the review area:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:  

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet):  
Acres:  

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters  

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams):  
  linear feet:  
  width (ft):  
- Other Non-wetland Waters MBR  
  acres:  
- Wetlands MBR  
  acres:  

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters  
  linear feet (ft),  
  width (ft)  
- Other waters  
  acres  
- Wetlands  
  acres  

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

- Maps, Plans, Plots or Plat Submitted by  
  Applicant/Consultant: WestLand Resources, Inc.  
- Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant  
  Office Concurs with data sheets/delineation report  
  Office Does Not Concur with data sheets/delineation report  
- Data Sheets Prepared by the Corps  
- Corps Navigable Water Study  
- US Geological Survey Hydrologic Atlas  
  - USGS NHD Data  
  - USGS 8 and 12 digit HUC Maps  
- US Geological Survey Map(s)  
  Scale and Quad Name:  
  Cactus Forest, Eloy North, Picacho Pass, Picacho Reservoir, Picacho Reservoir SE, Red Rock, and Valley Farms 7.5-Minute Quadrangles
Feature ID: 309

1. USDA Nat’l Res Conservation Service Soil Survey
2. National Wetlands Inventory Maps
3. State/Local Wetland Inventory Maps
4. FEMA/FIRM Maps
5. 100-year Floodplain Elevation is: (National Geodetic Vertical Datum of 1929)

- Aerial Photographs (Name and Date): Aerials Express Phoenix 2009, BING Aerial Imagery 2011
- Other Photographs (Name and Date): Ground Photos; June through July 2012, September through October 2012

- Previous Determinations File No. and Date of Response Letter:

- Applicable/Supporting Case Law Citation:

- Applicable/Supporting Scientific Literature Citation:

- Other Information, Please Specify:

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD) July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 31

State: AZ County/Parish/borough: Pinal City: N/A

Center coordinates of site: Lat. 32.8482°N Long. -111.2599°W

Name of nearest waterbody:

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:

Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date: 
☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):

☐ TNWs (new)
☐ Wetlands adjacent to TNWs
☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
☐ Non-RPWs that flow directly or indirectly into TNWs
☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
☐ Impoundments of jurisdictional waters
☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

Non-Wetlands waters ______ Linear Feet ______ Width (ft) and/or ______ Acres

Wetlands Acres: ______

c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: __________   ☐ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.02733
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         ☐ Tributary flows directly to TNW
         ✓ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

☐ TNWs Linear Feet: ____________________ Width (ft): __________ TNW Acres: __________

☐ Wetlands adjacent to TNWs: Acres: __________

2. RPWs that flow directly or indirectly into TNWs

☐ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

☐ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

Provide estimates for jurisdictional waters in the review area (check all that apply):

☐ Tributary waters Linear Feet: __________ Width (Ft): __________

☐ Other non-wetland waters: Acres: __________

3. Non-RPWs that flow directly or indirectly into TNWs.

☐ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.

Provide estimates of jurisdictional waters within the review area (check all that apply):

Length (Linear Feet): __________ Width (feet): __________ Acres: __________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

☐ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

☐ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

☐ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW

Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

☐ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- □ Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- □ Other Non-wetland Waters MBR acres:
- □ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- ✔ Non-wetland waters linear feet (ft), width (ft)
- □ Other waters acres
- □ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

### SECTION I: BACKGROUND INFORMATION

#### A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)

July 5, 2013

#### B. DISTRICT OFFICE, FILE NAME, AND NUMBER

Los Angeles District, File No. Pending

#### C. PROJECT LOCATION AND BACKGROUND INFORMATION:

**Drainage Feature 310**

- **State:** AZ  
- **County/Parish/borough:** Pinal County  
- **City:** N/A

- **Center coordinates of site:**  
  - Lat.: 32.8482°N  
  - Long.: -111.2599°W

- **Name of nearest waterbody:** Gila River between Powers Butte and Gillespie Dam

- **Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:**

- **Name of watershed or Hydrologic Unit Code (HUC):** 15050100

- **Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request:**
  - [ ]

- **Check if other sites (e.g., offsite mitigation sites, disposal sites, etc…) are associated with this action and are recorded on a different JD form:**
  - [ ]

#### D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

- Office (Desk) Determination. Date:  
- Field Determination. Date(s): 10/2012

### SECTION II: SUMMARY OF FINDINGS

#### A. RHA SECTION 10 DETERMINATION OF JURISDICTION

- There **Are No** "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.
- [ ] Waters subject to the ebb and flow of the tide.
- [ ] Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

#### B. CWA SECTION 404 DETERMINATION OF JURISDICTION

- There **Are No** "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.
  
  1. Waters of the U.S.
     
     a. **Indicate presence of water of U.S. in review area (Check all the apply):**
        
        - [ ] TNWs (new)
        - [ ] Wetlands adjacent to TNWs
        - [ ] Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
        - [ ] Non-RPWs that flow directly or indirectly into TNWs
        - [ ] Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
        - [ ] Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
        - [ ] Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
        - [ ] Impoundments of jurisdictional waters
        - [ ] Isolated (interstate or intrastate) waters, including isolated wetlands

     b. **Identify (estimate) size of waters of the U.S. in the review area**
        
        - Non-Wetlands waters  
        - Linear Feet  
        - Width (ft) and/or  
        - Acres

     - Wetlands Acres:

     c. **Limits (boundaries) of Jurisdiction based on:**

  2. Non-Regulated Waters/Wetlands (check if applicable):
     
     - [ ] Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

     Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

   Identify TNW: ____________________________  □ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.11725
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

      (a) Relationship with TNW

         □ Tributary flows directly to TNW
         ✔ Tributary flows through _______ tributaries before entering TNW

         Project waters are _______ (or more) river miles from TNW
### (b) General Tributary Characteristics

<table>
<thead>
<tr>
<th>Tributary is:</th>
<th>Natural</th>
<th>Explain:</th>
</tr>
</thead>
</table>

**Tributary properties with respect to top of bank (estimate):**
- **Average Width (ft):** [ ]
- **Average Depth (ft):** [ ]
- **Average Side Slopes:** 3:1

**Primary tributary substrate composition (check all that apply):**
- [ ] Silts
- [ ] Sands
- [ ] Concrete
- [ ] Muck
- [ ] Cobbles
- [ ] Gravel
- [ ] Substrate - Vegetation
- [ ] Other, Explain: [ ]

**Tributary Condition/Stability** [e.g., highly eroding, sloughing banks. Explain: ] Stable.

**Presence of Run/Riffle/Pool Complexes. Explain: ** Not present.

**Tributary Geometry:** Relatively Straight

**Tributary Gradient (approximate average slope):** 1%

### (c) Flow:

**Tributary Provides for:** Ephemeral Flow

**Estimate average number of flow events in review area/year:** 2-5

**Describe Flow Regime:** Ephemeral.

**Other Information on Duration and Volume:**

**Surface Flow is:** Discrete and Confined

**Subsurface Flow:** No

[ ] Dye (or other) test performed: [ ]

**Tributary Has (Check all that apply):**
- [ ] Bed and Banks
- [ ] OHWM (check all the apply): OHWM Indicators:
  - [ ] Clear, natural line impressed on the bank
  - [ ] Changes in soil character
  - [ ] Shelving
  - [ ] Vegetation matted down, bent or absent
  - [ ] Leaf litter disturbed or washed away
  - [ ] Sediment deposition
  - [ ] Water staining
  - [ ] Presence of litter and debris
  - [ ] Destruction of terrestrial vegetation
  - [ ] Presence of wrack line
  - [ ] Sediment sorting
  - [ ] Scour
  - [ ] Multiple observed or predicted flow events
  - [ ] Abrupt change in plant community

[ ] Discontinuous? Explain: [ ]
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: [ ]
- Oil or scum line along shore objects [ ]
- Fine shell or debris deposits (foreshore) [ ]
- Physical markings/characteristics [ ]
- Tidal gauges [ ]
- Other [ ]

- Mean High water Mark indicated by: [ ]
- Survey to available datum [ ]
- Physical markings [ ]
- Vegetation lines/changes in vegetation types [ ]

(iii) Chemical Characteristics:

Charaterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain:

Identify Specific Pollutants, if known:

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics:
- Wetland Fringe Characteristics:

Habitat for:

- Federally Listed Species Explain findings:
- Fish/Spawn Areas Explain findings:
- Other environmentally-sensitive species Explain findings:
- Aquatic/Wildlife diversity Explain:

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac):
- Wetland Type, Explain:
- Wetland Quality, Explain:

Project Wetlands Cross or Serve as State Boundaries, Explain:

(b) General Flow Relationship with Non-TNW:

- Wetland Flow is: Explain:
- Surface Flow is:
  - Characteristics:
- Subsurface Flow: Explain Findings:

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW
  - Discrete wetland hydrologic connection Explain:
  - Ecological connection Explain:
  - Separated by berm/barrier Explain:

(d) Proximity (Relationship) to TNW

- Project Wetlands: River Miles from TNW:
- Project Wetlands: Aerial Miles from TNW:
- Flow is From:
- Estimate approximate Location of Wetland within Floodplain:
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

☐ Riparian Buffer Characteristics (type, average width):

☐ Vegetation type/percent cover. Explain:

Habitat for:

☐ Federally Listed Species Explain:

☐ Fish/Spawn Areas Explain:

☐ Other environmentally-sensitive species Explain:

☐ Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

| □ TNWs  | Linear Feet: | Width (ft): | TNW Acres |
| □ Wetlands adjacent to TNWs: | Acres: |

2. RPWs that flow directly or indirectly into TNWs

| □ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: |
| □ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: |

Provide estimates for jurisdictional waters in the review area (check all that apply):

| □ Tributary waters | Linear Feet: | Width (ft): |
| □ Other non-wetland waters: | Acres: |

3. Non-RPWs that flow directly or indirectly into TNWs.

| □ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c. |

Provide estimates of jurisdictional waters within the review area (check all that apply):

| Length (Linear Feet): | Width (feet): | Acres: |

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

| □ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands. |

| □ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: |

| □ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is season in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: |

Provide acreage estimates for jurisdictional wetland in the review area: Acres: |

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

| □ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C. |

Provide acreage estimates for jurisdictional wetland in the review area: Acres: |

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres): [ ]

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: [ ]

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale: [ ]

Length (linear feet): [ ] Acres: [ ]

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters [ ]

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- [ ] Non wetland-Waters (i.e., rivers, streams): linear feet: [ ] width (ft): [ ]
- [ ] Other Non-wetland Waters MBR acres: [ ]
- [ ] Wetlands MBR acres: [ ]

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- [ ] Non-wetland waters 289.08 linear feet (ft), 3.36 width (ft)
- [ ] Other waters acres
- [ ] Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

   Non-Wetlands waters Linear Feet Width (ft) and/or Acres
   
   Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

   2. Non-Regulated Waters/Wetlands (check if applicable):

   ☒ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1; otherwise, Section III.B below.

1. TNW
   Identify TNW: 
   Summarize rationale supporting determination:
   □ Vegetation

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e., tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland, its relationship to the tributary is a significant nexus evaluation.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49,650
      Drainage Area (sq mi): 0.02555
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         □ Tributary flows directly to TNW
         ● Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:

Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:

Project waters are aerial (straight) miles from tributary to RPW:

Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):

Average Width (ft):

Average Depth (ft):

Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):

- [ ] Silts
- [ ] Sands
- [ ] Concrete
- [ ] Muck
- [ ] Cobble
- [ ] Gravel
- [ ] Substrate - Vegetation
- [ ] Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: 
- Wetland Fringe Characteristics: 

Habitat for:

- Federally Listed Species Explain findings: 
- Fish/Spawn Areas Explain findings: 
- Other environmentally sensitive species Explain findings: 
- Aquatic/Wildlife diversity Explain:

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac): 
- Wetland Type, Explain: 
- Wetland Quality, Explain: 

Project Wetlands Cross or Serve as State Boundaries, Explain:

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: 

Surface Flow is: 

Characteristics: 

Subsurface Flow: Explain Findings:

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW [ ]
- Wetland Not Directly Abutting Non-TNW [ ]
- Discrete wetland hydrologic connection Explain: 
- Ecological connection Explain: 
- Separated by berm/barrier Explain: 

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: 

Project Wetlands: Aerial Miles from TNW: 

Flow is From: 

Estimate approximate Location of Wetland within Floodplain: 
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if known:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer Characteristics (type, average width):
- Vegetation type/percent cover. Explain:

Habitat for:
- Federally Listed Species Explain:
- Fish/Spawn Areas Explain:
- Other environmentally-sensitive species Explain:
- Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of dowgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- TNWs Linear Feet: __________ Width (ft): __________ TNW Acres __________
- Wetlands adjacent to TNWs: Acres __________

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: __________
- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: __________
  Provide estimates for jurisdictional waters in the review area (check all that apply):
  - Tributary waters Linear Feet: __________ Width (Ft): __________ Acres: __________
  - Other non-wetland waters: Acres: __________

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.
  Provide estimates of jurisdictional waters within the review area (check all that apply):
  Length (Linear Feet): __________ Width (feet): __________ Acres: __________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: __________
  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: __________
  Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
  Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: [Blank Box]

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): [Blank Box] Acres: [Blank Box]

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters: [Blank Box]

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- [ ] Non wetland-Waters (i.e., rivers, streams): linear feet: [Blank Box] width (ft): [Blank Box]
- [ ] Other Non-wetland Waters MBR acres: [Blank Box]
- [ ] Wetlands MBR acres: [Blank Box]

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- [X] Non-wetland waters 201.97 linear feet (ft), 3.05 width (ft)
- [ ] Other waters acres
- [ ] Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

- [X] Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.
- [X] Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant
  - [ ] Office Concurs with data sheets/delineation report
  - [ ] Office Does Not Concur with data sheets/delineation report

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:  Drainage Feature 312

State:  AZ  County/Parish/borough:  Pinal County  City:  N/A

Center coordinates of site:  Lat.  32.8482°N  Long.  -111.2599°W

Name of nearest waterbody:  

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC):  15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request

☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination.  Date:  

✓ Field Determination.  Date(s):  10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):

☐ TNWs (new)

☐ Wetlands adjacent to TNWs

☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs

☐ Non-RPWs that flow directly or indirectly into TNWs

☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs

☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs

☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs

☐ Impoundments of jurisdictional waters

☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

Non-Wetlands waters  Linear Feet  Width (ft) and/or  Acres

Wetlands Acres:  

c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

✓ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain:  Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW: ____________________________ ■ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

(i) General Area Conditions:

Watershed Size (sq mi): 49650
Drainage Area (sq mi): 0.00483
Average Annual Rainfall (in): 10
Average Annual Snowfall (in): 0

(ii) Physical Characteristics:

(a) Relationship with TNW

☐ Tributary flows directly to TNW
☑ Tributary flows through _______ tributaries before entering TNW

Project waters are _______ river miles from TNW
<table>
<thead>
<tr>

  - Concrete
  - Muck
  - Cobbles
  - Gravel
  - Substrate - Vegetation
  - Other, Explain: 

- **Tributary Condition/Stability** [e.g., highly eroding, sloughing banks. Explain:]
  - Stable.

- **Presence of Run/Riffle/Pool Complexes. Explain:** 
  - Not present.

- **Tributary Geometry:** 
  - Relatively Straight

- **Tributary Gradient (approximate average slope):** 1%

### (c) Flow

- **Tributary Provides for:** Ephemeral Flow
- **Estimate average number of flow events in review area/year:** 2-5
- **Describe Flow Regime:** Ephemeral.

**Other Information on Duration and Volume:**

**Surface Flow is:** Discrete and Confined 
**Characteristics:**

**Subsurface Flow:** No Explain: 

- **Dye (or other) test performed:** 

**Tributary Has (Check all that apply):**

- Bed and Banks
- **OHWM (check all the apply): OHWM Indicators:**
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community

**Other (list):**

- **Discontinuous? Explain:** 

If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: __________
- Mean High water Mark indicated by: __________
- oil or scum line along shore objects
- fine shell or debris deposits (foreshore)
- physical markings/characteristics
- tidal gauges
- other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: __________

Identify Specific Pollutants, if known: __________

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: __________
- Wetland Fringe Characteristics: __________

Habitat for:

- Federally Listed Species Explain findings: __________
- Fish/Spawn Areas Explain findings: __________
- Other environmentally-sensitive species Explain findings: __________
- Aquatic/Wildlife diversity Explain: __________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:
- Wetland Size (ac): __________
- Wetland Type, Explain: __________
- Wetland Quality, Explain: __________

Project Wetlands Cross or Serve as State Boundaries, Explain: __________

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: __________ Explain: __________

Surface Flow is: __________

Characteristics: __________

Subsurface Flow: __________ Explain Findings: __________

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW
- Discrete wetland hydrologic connection Explain: __________
- Ecological connection Explain: __________
- Separated by berm/barrier Explain: __________

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: __________

Project Wetlands: Aerial Miles from TNW: __________

Flow is From: __________

Estimate approximate Location of Wetland within Floodplain: __________
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: etc.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- [ ] Riparian Buffer Characteristics (type, average width):
- [ ] Vegetation type/percent cover. Explain:

Habitat for:

- [ ] Federally Listed Species Explain:
- [ ] Fish/Spawn Areas Explain:
- [ ] Other environmentally-sensitive species Explain:
- [ ] Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - [ ] TNWs  Linear Feet: ___________________ Width (ft): ______ TNW Acres ______
   - [ ] Wetlands adjacent to TNWs: Acres: 

2. RPWs that flow directly or indirectly into TNWs
   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: ___________________
   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: ___________________.
     Provide estimates for jurisdictional waters in the review are (check all that apply):
     - [ ] Tributary waters  Linear Feet: __________ Width (Ft): ______
     - [ ] Other non-wetland waters: Acres: 

3. Non-RPWs that flow directly or indirectly into TNWs.
   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.

     Provide estimates of jurisdictional waters within the review area (check all that apply):
     Length (Linear Feet): __________ Width (feet): __________ Acres: 

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: ____________________
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: ____________________

     Provide acreage estimates for jurisdictional wetland in the review area: Acres: 

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

     Provide acreage estimates for jurisdictional wetland in the review area: Acres: 

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters
Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- [ ] Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- [ ] Other Non-wetland Waters MBR acres:
- [ ] Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- [x] Non-wetland waters 219.75 linear feet (ft), 3.45 width (ft)
- [ ] Other waters acres
- [ ] Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

**SECTION II: SUMMARY OF FINDINGS**

**A. RHA SECTION 10 DETERMINATION OF JURISDICTION**

There are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

- [ ] Waters subject to the ebb and flow of the tide.
- [ ] Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

**B. CWA SECTION 404 DETERMINATION OF JURISDICTION**

There are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      - [ ] TNWs (new)
      - [ ] Wetlands adjacent to TNWs
      - [ ] Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      - [ ] Non-RPWS that flow directly or indirectly into TNW:
      - [ ] Wetlands directly abutting RPWS that flow directly or indirectly into TNWs
      - [ ] Wetlands adjacent to but not directly abutting RPWS that flow directly or indirectly into TNWs
      - [ ] Wetlands adjacent to non-RPWS that flow directly or indirectly into TNWs
      - [ ] Impoundments of jurisdictional waters
      - [ ] Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters: Linear Feet Width (ft) and/or Acres
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   - [x] Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
   
**Explain:** Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1; only, if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1; otherwise, see Section III.B below.

1. TNW

Identify TNW:

☐ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

(i) General Area Conditions:

<table>
<thead>
<tr>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Watershed Size (sq mi)</td>
<td>49650</td>

- Wetland Fringe Characteristics: ____________________________________________________________________________

Habitat for:

- Federally Listed Species Explain findings: ____________________________________________________________________________
- Fish/Spawn Areas Explain findings: ____________________________________________________________________________
- Other environmentally sensitive species Explain findings: ____________________________________________________________________________
- Aquatic/Wildlife diversity Explain: ____________________________________________________________________________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac): ____________
- Wetland Type, Explain: ____________________________________________________________________________
- Wetland Quality, Explain: ____________________________________________________________________________

Project Wetlands Cross or Serve as State Boundaries, Explain: ____________________________________________________________________________

(b) General Flow Relationship with Non-TNW:

- Wetland Flow is: ____________________________________________________________________________
- Surface Flow is: ____________________________________________________________________________

Characteristics: ____________________________________________________________________________

Subsurface Flow: ____________________________________________________________________________

Explain Findings: ____________________________________________________________________________

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW
  - Discrete wetland hydrologic connection Explain: ____________________________________________________________________________
  - Ecological connection Explain: ____________________________________________________________________________
  - Separated by berm/barrier Explain: ____________________________________________________________________________

(d) Proximity (Relationship) to TNW:

- Project Wetlands: River Miles from TNW: ____________
- Project Wetlands: Aerial Miles from TNW: ____________
- Flow is From: ____________________________________________________________________________

Estimate approximate Location of Wetland within Floodplain: ____________________________________________________________________________
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: etc.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- □ Riparian Buffer  Characteristics (type, average width):
- □ Vegetation type/percent cover. Explain:

Habitat for:
- □ Federally Listed Species  Explain:
- □ Fish/Spawn Areas  Explain:
- □ Other environmentally-sensitive species  Explain:
- □ Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

   Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

   This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

   □ TNWs   Linear Feet:   Width (ft):   TNW Acres
   □ Wetlands adjacent to TNWs:   Acres:

2. RPWs that flow directly or indirectly into TNWs

   □ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

   □ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

   Provide estimates for jurisdictional waters in the review area (check all that apply):

   □ Tributary waters   Linear Feet:   Width (ft).
   □ Other non-wetland waters:   Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

   □ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

   Provide estimates of jurisdictional waters within the review area (check all that apply):

   Length (Linear Feet):   Width (feet):   Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

   □ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

   □ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

   □ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW

   Provide acreage estimates for jurisdictional wetland in the review area:   Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   □ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

   Provide acreage estimates for jurisdictional wetland in the review area:   Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- [ ] Non wetland-Waters (i.e., rivers, streams): linear feet : width (ft):
- [ ] Other Non-wetland Waters MBR acres:
- [ ] Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- [ ] Non-wetland waters 991.99 linear feet (ft), 5.78 width (ft)
- [ ] Other waters acres
- [ ] Wetlands acres

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICATION DETERMINATION (JD)  July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 314

State: AZ  County/Parish/borough: Pinal City: N/A

Center coordinates of site: Lat. 32.8482°N  Long. -111.2599°W

Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:  

☒ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "Navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):
    ☐ TNWs (new)
    ☐ Wetlands adjacent to TNWs
    ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
    ☐ Non-RPWs that flow directly or indirectly into TNWs
    ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
    ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
    ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
    ☐ Impoundments of jurisdictional waters
    ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☒ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ___________  □ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.18566
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

      (a) Relationship with TNW
         □ Tributary flows directly to TNW
         □ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW: 
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: 
Project waters are aerial (straight) miles from tributary to RPW: 
Project waters cross or serve as state boundaries. Explain: 
Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain: 

Tributary properties with respect to top of bank (estimate): 
Average Width (ft): 
Average Depth (ft): 
Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- ✔ Silts
- ☐ Sands
- ☐ Concrete
- ☐ Muck
- ☐ Gravel
- ☒ Substrate - Vegetation
- Other, Explain: 

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics: 
Subsurface Flow: No Explain: 

Dye (or other) test performed: 

Tributary Has (Check all that apply):
- ☐ Bed and Banks
- ☒ OHWM (check all the apply): OHWM Indicators:
  - ✔ Clear, natural line impressed on the bank
  - ✔ Changes in soil character
  - ☐ Shelving
  - ☐ Vegetation matted down, bent or absent
  - ☐ Leaf litter disturbed or washed away
  - ☐ Sediment deposition
  - ☐ Water staining
  - Other (list): 
- ☐ Discontinuous?

Presence of litter and debris
Destruction of terrestrial vegetation
Presence of wrack line
Sediment sorting
Scour
Multiple observed or predicted flow events
Abrupt change in plant community
(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - [ ] TNWs  Linear Feet: ______ Width (ft): ______ TNW Acres ______
   - [ ] Wetlands adjacent to TNWs: Acres: ______

2. RPWs that flow directly or indirectly into TNWs
   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: ______
   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: ______
     Provide estimates for jurisdictional waters in the review area (check all that apply):
     - [ ] Tributary waters  Linear Feet: ______ Width (ft): ______
     - [ ] Other non-wetland waters: Acres: ______

3. Non-RPWs that flow directly or indirectly into TNWs.
   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     Provide estimates of jurisdictional waters within the review area (check all that apply):
     Length (Linear Feet): ______ Width (feet): ______ Acres: ______

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: ______
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: ______
       Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
       Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres): __________

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: __________

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale: __________

Length (linear feet): __________ Acres: __________

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters: __________

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: __________ width (ft): __________
- Other Non-wetland Waters MBR acres: __________
- Wetlands MBR acres: __________

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters 834.23 linear feet (ft), 33.05 width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 315  
State: AZ  
County/Parish/borough: Pinal County  
City: N/A

Center coordinates of site: Lat. 32.8482°N  Long. -111.2599°W

Name of nearest waterbody:

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  
Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request  
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)  
☐ Office (Desk) Determination. Date:  
☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There ☐ Are Yes ☐ navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There ☐ Are Yes ☐ "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)  
      ☐ Wetlands adjacent to TNWs  
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
      ☐ Non-RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
      ☐ Impoundments of jurisdictional waters  
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres  
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: [ ]
   - Vegetation: [ ]

   Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary, that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) **General Area Conditions:**
   - Watershed Size (sq mi): 49650
   - Drainage Area (sq mi): 0.02058
   - Average Annual Rainfall (in): 10
   - Average Annual Snowfall (in): 0

   (ii) **Physical Characteristics:**

   (a) **Relationship with TNW**
   - [ ] Tributary flows directly to TNW
   - [ ] Tributary flows through 4 tributaries before entering TNW

   Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW: 
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: 
Project waters are aerial (straight) miles from tributary to RPW: 
Project waters cross or serve as state boundaries. Explain: 

Identify flow route to TNW 
Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics
Tributary is: Natural Explain: 
Tributary properties with respect to top of bank (estimate):
Average Width (ft): 
Average Depth (ft): 
Average Side Slopes: 3:1
Primary tributary substrate composition (check all that apply):
- [ ] Silts
- [ ] Sands
- [ ] Concrete
- [ ] Muck
- [ ] Gravel
- [ ] Substrate - Vegetation
Other, Explain: 
Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.
Presence of Run/Riffle/Pool Complexes. Explain: Not present.
Tributary Geometry: Relatively Straight
Tributary Gradient (approximate average slope): 1%

(c) Flow:
Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5
Describe Flow Regime: Ephemeral.
Other Information on Duration and Volume: 
Surface Flow is: Discrete and Confined Characteristics: 
Subsurface Flow: No Explain: 
Dye (or other) test performed: 

Tributary Has (Check all that apply):

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer  Characteristics (type, average width):
- Vegetation  type/percent cover. Explain:
- Habitat for:
  - Federally Listed Species  Explain:
  - Fish/Spawn Areas  Explain:
  - Other environmentally-sensitive species  Explain:
  - Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- TNWs Linear Feet: Width (ft): TNW Acres
- Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
  Provide estimates for jurisdictional waters in the review are (check all that apply):
  - Tributary waters Linear Feet: Width (ft).
  - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
  Provide estimates of jurisdictional waters within the review area (check all that apply):
  Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW
  Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
  Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): [ ] Acres: [ ]

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- [ ] Non wetland-Waters (i.e., rivers, streams): Linear feet: [ ] Width (ft): [ ]
- [ ] Other Non-wetland Waters MBR Acres: [ ]
- [ ] Wetlands MBR Acres: [ ]

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- [ ] Non-wetland waters 240.25 linear feet (ft), 4.06 width (ft)
- [ ] Other waters Acres
- [ ] Wetlands Acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

Additional Comments to Support JD:
SECTION I: BACKGROUND INFORMATION
A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)    July 5, 2013
B. DISTRICT OFFICE, FILE NAME, AND NUMBER  Los Angeles District, File No. Pending
C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 316
   State: AZ    County/Parish/borough: Pinal County
   City: N/A
   Center coordinates of site: Lat. 32.8482°N Long. -111.2599°W
   Name of nearest waterbody:
   Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:
   Gila River between Powers Butte and Gillespie Dam
   Name of watershed or Hydrologic Unit Code (HUC): 15050100
   ☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
   ☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a
different JD form.
D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)
   ☐ Office (Desk) Determination. Date: ____________________
   ☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS
A. RHA SECTION 10 DETERMINATION OF JURISDICTION
There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329 in
the review area.
☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION
There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands
   
   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters   Linear Feet Width (ft) and/or Acres
      Wetlands Acres: ____________________
   
   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
  ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
    Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered
    jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a
    significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW:   

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
       Watershed Size (sq mi): 49650
       Drainage Area (sq mi): 1.07033
       Average Annual Rainfall (in): 10
       Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
       (a) Relationship with TNW
           Tributary flows directly to TNW

           Tributary flows through 4 tributaries before entering TNW

           Project waters are 30 (or more) river miles from TNW
Feature ID: 316

U.S Army Corps of Engineers

Project waters are: river Miles from tributary to RPW:
Project waters are: 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are: aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
Average Width (ft):
Average Depth (ft):
Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Gravel
- Substrate - Vegetation
- Bedrock
- Muck
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain]: Stable.
Presence of Run/Riffle/Pool Complexes. Explain: Not present.
Tributary Geometry: Relatively Straight
Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5
Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:
Subsurface Flow: No Explain:

Dye (or other) test performed:

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
- Presence of litter and debris
- Destruction of terrestrial vegetation
- Presence of wrack line
- Sediment sorting
- Scour
- Multiple observed or predicted flow events
- Abrupt change in plant community

Discontinuous? Explain:
316
Feature ID: APPROVED JURISDICTIONAL DETERMINATION FORM
U.S Army Corps of Engineers

If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):
- High tide line indicated by: 
- Oil or scum line along shore objects
- Fine shell or debris deposits (foreshore)
- Physical markings/characteristics
- Tidal gauges
- Other

[□] Mean high water mark indicated by: 
- Survey to available datum
- Physical markings
- Vegetation lines changes in vegetation types

(iii) Chemical Characteristics:
Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):
Explain: 
Identify Specific Pollutants, if known:

(iv) Biological Characteristics. Channel supports (check all that apply):
- Riparian Corridor Characteristics: 
- Wetland Fringe Characteristics: 
Habitat for:
- Federally Listed Species Explain findings: 
- Fish/Spawn Areas Explain findings: 
- Other environmentally sensitive species Explain findings: 
- Aquatic/Wildlife diversity Explain:

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW
(i) Physical Characteristics:
(a) General Wetland Characteristics
Properties:
- Wetland Size (ac): 
- Wetland Type, Explain: 
- Wetland Quality, Explain: 
Project Wetlands Cross or Serve as State Boundaries, Explain:
(b) General Flow Relationship with Non-TNW:
- Wetland Flow is: Explain: 
- Surface Flow is: 
- Characteristics: 
- Subsurface Flow: Explain Findings: 
(c) Wetland Adjacency Determination with Non-TNW:
- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW
- Discrete wetland hydrologic connection Explain:
- Ecological connection Explain:
- Separated by berm/barrier Explain:
(d) Proximity (Relationship) to TNW
- Project Wetlands: River Miles from TNW: 
- Project Wetlands: Aerial Miles from TNW: 
Flow is From: 
Estimate approximate Location of Wetland within Floodplain:
(ii) Chemical Characteristics:
Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- ☐ Riparian Buffer  Characteristics (type, average width):
- ☐ Vegetation  type/percent cover. Explain:

Habitat for:

- ☐ Federally Listed Species  Explain:
- ☐ Fish/Spawn Areas  Explain:
- ☐ Other environmentally-sensitive species  Explain:
- ☐ Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of aTNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- [ ] TNWs
  - Linear Feet: 
  - Width (ft): 
  - TNW Acres
- [ ] Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs

- [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: 
- [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: 
  - Provide estimates for jurisdictional waters in the review area (check all that apply):
    - [ ] Tributary waters
      - Linear Feet: 
      - Width (ft): 
    - [ ] Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

- [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
  
  Provide estimates of jurisdictional waters within the review area (check all that apply):
  - Length (Linear Feet): 
  - Width (feet): 
  - Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: 
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
  
  Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non-wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
☐ Other Non-wetland Waters MBR acres:
☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters 2158.08 linear feet (ft), 10.43 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

☐ Office (Desk) Determination. Date:  
☐ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWS that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWS that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWS that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWS that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters [ ] Linear Feet  [ ] Width (ft) and/or [ ] Acres
      Wetlands Acres: [ ]

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW: ____________________________  ☐ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.01136
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   ☐ Tributary flows directly to TNW
   ☑ Tributary flows through ____________ tributaries before entering TNW
   Project waters are ________ (or more) river miles from TNW

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNW, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- TNWs (Linear Feet: Width (ft): TNW Acres: )
- Wetlands adjacent to TNWs (Acres: )

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: Provide estimates for jurisdictional waters in the review area (check all that apply):
  - Tributary waters (Linear Feet: Width (Ft): )
  - Other non-wetland waters (Acres: )

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c. Provide estimates of jurisdictional waters within the review area (check all that apply):
  - Length (Linear Feet): Width (feet): Acres: 

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres: 

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C. Provide acreage estimates for jurisdictional wetland in the review area: Acres: 

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section III.C2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters linear feet (ft), width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

APPROVED JURISDICTIONAL DETERMINATION FORM
U.S. Army Corps of Engineers

Feature ID: 318

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)
   July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER
   Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:
   Drainage Feature 318
   State: AZ  County/Parish/borough: Pinal  City: N/A
   Center coordinates of site: Lat. 32.8482°N  Long. -111.2599°W
   Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam
   Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:
   Name of watershed or Hydrologic Unit Code (HUC): 15050100
   ☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
   □ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a
different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)
   □ Office (Desk) Determination. Date: 
   ☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION
   There □ Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in
   the review area.
   □ Waters subject to the ebb and flow of the tide.
   □ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION
   There □ Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.
   1. Waters of the U.S.
      a. Indicate presence of water of U.S. in review area (Check all the apply):
         □ TNWs (new)
         □ Wetlands adjacent to TNWs
         □ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
         □ Non-RPWs that flow directly or indirectly into TNWs
         □ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
         □ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
         □ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
         □ Impoundments of jurisdictional waters
         □ Isolated (interstate or intrastate) waters, including isolated wetlands
      b. Identify (estimate) size of waters of the U.S. in the review area
         Non-Wetlands waters Linear Feet Width (ft) and/or Acres
         Wetlands Acres:
      c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered
   jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a
   significant nexus with the downstream TNW.

SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________________  
   □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.04622
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
   (a) Relationship with TNW
   □ Tributary flows directly to TNW
   ✓ Tributary flows through 4 tributaries before entering TNW
   Project waters are 30 (or more) river miles from TNW
**Feature ID:** APPROVED JURISDICTIONAL DETERMINATION FORM

U.S Army Corps of Engineers

Project waters are river Miles from tributary to RPW: 
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: 
Project waters are aerial (straight) miles from tributary to RPW: 
Project waters cross or serve as state boundaries. Explain: 

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

**b) General Tributary Characteristics**

- Tributary is: Natural
  
- Tributary properties with respect to top of bank (estimate):
  - Average Width (ft): 
  - Average Depth (ft): 
  - Average Side Slopes: 3:1

- Primary tributary substrate composition (check all that apply):
  - Silts
  - Sands
  - Concrete
  - Muck
  - Cobbles
  - Gravel
  - Substrate - Vegetation
  - Other, Explain: 

- Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

- Presence of Run/Riffle/Pool Complexes. Explain: Not present.

- Tributary Geometry: Relatively Straight

- Tributary Gradient (approximate average slope): 1%

**c) Flow**

- Tributary Provides for: Ephemeral Flow
- Estimate average number of flow events in review area/year: 2-5
- Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

- Surface Flow is: Discrete and Confined
- Characteristics: 
- Subsurface Flow: No
- Explain: 
- Dye (or other) test performed: 

- Tributary Has (Check all that apply):
  - Bed and Banks
  - OHWM (check all the apply): OHWM Indicators: 
    - Clear, natural line impressed on the bank
    - Changes in soil character
    - Shelving
    - Vegetation matted down, bent or absent
    - Leaf litter disturbed or washed away
    - Sediment deposition
    - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community

Other (list): 

- Discontinuous? Explain: 

If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: __________________________
- Mean High water Mark indicated by: __________________________
- oil or scum line along shore objects
- fine shell or debris deposits (foreshore)
- physical markings/characteristics
- tidal gauges
- other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: __________________________

Identify Specific Pollutants, if known: __________________________

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: __________________________
- Wetland Fringe Characteristics: __________________________

Habitat for:

Surface Flow is: __________________________

Characteristics: __________________________

Subsurface Flow: Explain Findings: __________________________

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW

- Discrete wetland hydrologic connection Explain: __________________________
- Ecological connection Explain: __________________________
- Separated by berm/barrier Explain: __________________________

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: __________________________

Project Wetlands: Aerial Miles from TNW: __________________________

Flow is From: __________________________

Estimate approximate Location of Wetland within Floodplain: __________________________
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- [ ] Riparian Buffer  Characteristics (type, average width):
- [ ] Vegetation  type/percent cover. Explain:

Habitat for:

- [ ] Federally Listed Species  Explain:
- [ ] Fish/Spawn Areas  Explain:
- [ ] Other environmentally-sensitive species  Explain:
- [ ] Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downsgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

<table>
<thead>
<tr>
<th>Item</th>
<th>Linear Feet:</th>
<th>Width (ft):</th>
<th>TNW Acres</th>
</tr>
</thead>
<tbody>
<tr>
<td>TNWs</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Wetlands adjacent to TNWs</td>
<td>Acres:</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: 

- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

  Provide estimates for jurisdictional waters in the review area (check all that apply):

<table>
<thead>
<tr>
<th>Item</th>
<th>Linear Feet:</th>
<th>Width (ft):</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tributary waters</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Other non-wetland waters</td>
<td>Acres:</td>
<td></td>
</tr>
</tbody>
</table>

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

  Provide estimates of jurisdictional waters within the review area (check all that apply):

<table>
<thead>
<tr>
<th>Length (Linear Feet):</th>
<th>Width (feet):</th>
<th>Acres:</th>
</tr>
</thead>
</table>

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  
  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW

  Provide acrages for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

  Provide acrages for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): _______ Acres: _______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: _______ width (ft): _______

☐ Other Non-wetland Waters MBR acres: _______

☐ Wetlands MBR acres: _______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters _______ linear feet (ft), _______ width (ft)

☐ Other waters _______ acres

☐ Wetlands _______ acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:  
Drainage Feature  
State: AZ  
County/Parish/borough: Pinal County  
City: N/A  

Center coordinates of site: Lat. 32.8482°N  
Long. -111.2599°W

Name of nearest waterbody: 
Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: 

Name of watershed or Hydrologic Unit Code (HUC):  
15050100

☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request

☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date: 
☐ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):

☐ TNWs (new)

☐ Wetlands adjacent to TNWs

☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs

☐ Non-RPWs that flow directly or indirectly into TNWs

☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs

☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs

☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs

☐ Impoundments of jurisdictional waters

☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

Non-Wetlands waters Linear Feet Width (ft) and/or Acres

Wetlands Acres:

c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain:  
Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

   Identify TNW: [Blank]

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.00220
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   [Blank] Tributary flows directly to TNW
   ☑ Tributary flows through 4 tributaries before entering TNW

   Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW: 
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: 
Project waters are aerial (straight) miles from tributary to RPW: 
Project waters cross or serve as state boundaries. Explain: 
Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain: 

Tributary properties with respect to top of bank (estimate):
- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Cobble
- Gravel
- Substrate - Vegetation
Other, Explain: 

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight 

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Describe Flow Regime: Ephemeral.

Estimate average number of flow events in review area/year: 2-5

Surface Flow is: Discrete and Confined Characteristics: 
Subsurface Flow: No Explain: 

Dye (or other) test performed:

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
Other (list): 
- Presence of litter and debris
- Destruction of terrestrial vegetation
- Presence of wrack line
- Sediment sorting
- Scour
- Multiple observed or predicted flow events
- Abrupt change in plant community

Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: __________  □ Oil or scum line along shore objects
- Fine shell or debris deposits (foreshore): __________  □ Physical markings
- Tidal gauges __________  □ Vegetation lines/changes in vegetation types
- Other __________  □ Survey to available datum

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: __________

Identify Specific Pollutants, if known: __________

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: __________
- Wetland Fringe Characteristics: __________

Habitat for:

- Federally Listed Species Explain findings: __________
- Fish/Spawn Areas Explain findings: __________
- Other environmentally-sensitive species Explain findings: __________
- Aquatic/Wildlife diversity Explain: __________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac): __________
- Wetland Type, Explain: __________
- Wetland Quality, Explain: __________

Project Wetlands Cross or Serve as State Boundaries, Explain: __________

(b) General Flow Relationship with Non-TNW:

- Wetland Flow is: __________ Explain: __________
- Surface Flow is: __________
  - Characteristics: __________
  - Subsurface Flow: __________ Explain Findings: __________

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW
  - Discrete wetland hydrologic connection Explain: __________
  - Ecological connection Explain: __________
  - Separated by berm/barrier Explain: __________

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: __________
Project Wetlands: Aerial Miles from TNW: __________
Flow is From: __________
Estimate approximate Location of Wetland within Floodplain: __________
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

☐ Riparian Buffer  Characteristics (type, average width): 

☐ Vegetation  type/percent cover. Explain:

Habitat for:

☐ Federally Listed Species  Explain:

☐ Fish/ Spawn Areas  Explain:

☐ Other environmentally-sensitive species  Explain:

☐ Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

   - TNWs
   - Linear Feet: Width (ft): TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs

   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: Width (Ft).
       - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c. Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C. Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Feature ID: 319

Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): _____ Acres: _____

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: _____ width (ft): _____
☐ Other Non-wetland Waters MBR acres: _____
☐ Wetlands MBR acres: _____

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 114.52 linear feet (ft), 3.54 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION
A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD) July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 32

State: AZ  County/Parish/borough: Pinal City: N/A

Center coordinates of site: Lat. 32.8482°N  Long. -111.2599°W

Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)
☐ Office (Desk) Determination. Date: 
☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS
A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There □ Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329 in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There □ Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ______________________  □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.02111
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         □ Tributary flows directly to TNW
         ✔ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW: 
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: 
Project waters are aerial (straight) miles from tributary to RPW: 
Project waters cross or serve as state boundaries. Explain: 

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural 
Explain: 

Tributary properties with respect to top of bank (estimate):
Average Width (ft): 
Average Depth (ft): 
Average Side Slopes: 3:1 

Primary tributary substrate composition (check all that apply):
- [ ] Silts 
- [ ] Sands 
- [ ] Concrete 
- [ ] Muck 
- [ ] Cobble 
- [ ] Gravel 
- [ ] Substrate - Vegetation 
Other, Explain: 

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable. 

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight 

Tributary Gradient (approximate average slope): 1% 

(c) Flow:
Tributary Provides for: Ephemeral Flow 
Estimate average number of flow events in review area/year: 2-5 
Describe Flow Regime: Ephemeral. 

Other Information on Duration and Volume: 

Surface Flow is: Discrete and Confined 
Characteristics: 
Subsurface Flow: No 
Explain: 

Dye (or other) test performed: 

Tributary Has (Check all that apply):
- [ ] Bed and Banks 
- [ ] OHWM (check all the apply): OHWM Indicators:
  - [ ] Clear, natural line impressed on the bank 
  - [ ] Changes in soil character 
  - [ ] Shelving 
  - [ ] Vegetation matted down, bent or absent 
  - [ ] Leaf litter disturbed or washed away 
  - [ ] Sediment deposition 
  - [ ] Water staining 
Other (list): 

- [ ] Discontinuous? Explain: 

Other (list): 

Presence of litter and debris 
Destruction of terrestrial vegetation 
Presence of wrack line 
Sediment sorting 
Scour 
Multiple observed or predicted flow events 
Abrupt change in plant community
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- [ ] High tide line indicated by:
- [ ] Mean High water Mark indicated by:
  - [ ] oil or scum line along shore objects
  - [ ] fine shell or debris deposits (foreshore)
  - [ ] physical markings/characteristics
  - [ ] tidal gauges
  - [ ] other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

- [ ] Identify Specific Pollutants, if known:

(iv) Biological Characteristics. Channel supports (check all that apply):

- [ ] Riparian Corridor Characteristics:
- [ ] Wetland Fringe Characteristics:

Habitat for:

- [ ] Federally Listed Species Explain findings:
- [ ] Fish/Spawn Areas Explain findings:
- [ ] Other environmentally sensitive species Explain findings:
- [ ] Aquatic/Wildlife diversity Explain:

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac):
- Wetland Type, Explain:
- Wetland Quality, Explain:

Project Wetlands Cross or Serve as State Boundaries, Explain:

(b) General Flow Relationship with Non-TNW:

- Wetland Flow is: Explain:
- Surface Flow is:

  Characteristics:

Subsurface Flow: Explain Findings:

(c) Wetland Adjacency Determination with Non-TNW:

- [ ] Wetland Directly Abutting Non-TNW
- [ ] Wetland Not Directly Abutting Non-TNW

  - Discrete wetland hydrologic connection Explain:
  - Ecological connection Explain:
  - Separated by berm/barrier Explain:

(d) Proximity (Relationship) to TNW

- Project Wetlands: River Miles from TNW:
- Project Wetlands: Aerial Miles from TNW:

Flow is From:

Estimate approximate Location of Wetland within Floodplain:
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer  Characteristics (type, average width):
- Vegetation  type/percent cover. Explain:
- Habitat for:  
  - Federally Listed Species  Explain:
  - Fish/Spawn Areas  Explain:
  - Other environmentally-sensitive species  Explain:
  - Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - [ ] TNWs Linear Feet: __________ Width (ft): __________ TNW Acres __________
   - [ ] Wetlands adjacent to TNWs: Acres: __________

2. RPWs that flow directly or indirectly into TNWs
   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - [ ] Tributary waters Linear Feet: __________ Width (Ft). Acres: __________
       - [ ] Other non-wetland waters: Acres: __________

3. Non-RPWs that flow directly or indirectly into TNWs.
   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet): __________ Width (feet): __________ Acres: __________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: 

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale: 
Length (linear feet): Acres: 

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters 

Explain finding of no Significant Nexus: See Section III.C. 

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft): 
- Other Non-wetland Waters MBR acres: 
- Wetlands MBR acres: 

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters linear feet (ft), width (ft) 
- Other waters acres 
- Wetlands acres 

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD) 
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 320

| State: AZ | County/Parish/borough: Pinal County | City: N/A |
| Center coordinates of site: Lat. 32.8482°N Long. -111.2599°W |
| Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam |
| Name of watershed or Hydrologic Unit Code (HUC): 15050100 |

✓ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date: 
✓ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):

☐ TNWs (new)
☐ Wetlands adjacent to TNWs
☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
☐ Non-RPWs that flow directly or indirectly into TNWs
☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
☐ Impoundments of jurisdictional waters
☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

<table>
<thead>
<tr>
<th>Non-Wetlands waters</th>

<td></td>
</tr>
</tbody>
</table>

c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

✓ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: 
   - ☐ Vegetation
   - Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   - Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      - Watershed Size (sq mi): 49650
      - Drainage Area (sq mi): 0.09741
      - Average Annual Rainfall (in): 10
      - Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         - ☑ Tributary flows directly to TNW
         - ☐ Tributary flows through 4 tributaries before entering TNW
         - Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:
Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
Average Width (ft):
Average Depth (ft):
Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Cobbles
- Gravel
- Substrate - Vegetation

Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:
Subsurface Flow: No Explain:

Dye (or other) test performed:

Tributary Has (Check all that apply):

- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining

Other (list):

- Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- [ ] High tide line indicated by: ________________________  [ ] Mean High water Mark indicated by: ________________________
- [ ] oil or scum line along shore objects
- [ ] fine shell or debris deposits (foreshore)
- [ ] physical markings/characteristics
- [ ] tidal gauges
- [ ] other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: ________________________

Identify Specific Pollutants, if known: ________________________

(iv) Biological Characteristics. Channel supports (check all that apply):

- [ ] Riparian Corridor Characteristics: ________________________
- [ ] Wetland Fringe Characteristics: ________________________

Habitat for:

- [ ] Federally Listed Species Explain findings: ________________________
- [ ] Fish/Spawn Areas Explain findings: ________________________
- [ ] Other environmentally-sensitive species Explain findings: ________________________
- [ ] Aquatic/Wildlife diversity Explain: ________________________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac): ________________________
- Wetland Type, Explain: ________________________
- Wetland Quality, Explain: ________________________

Project Wetlands Cross or Serve as State Boundaries, Explain: ________________________

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: ________________________ Explain: ________________________

Surface Flow is: ________________________

Characteristics: ________________________

Subsurface Flow: ________________________ Explain Findings: ________________________

(c) Wetland Adjacency Determination with Non-TNW:

- [ ] Wetland Directly Abutting Non-TNW
- [ ] Wetland Not Directly Abutting Non-TNW

- [ ] Discrete wetland hydrologic connection Explain: ________________________
- [ ] Ecological connection Explain: ________________________
- [ ] Separated by berm/barrier Explain: ________________________

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: ________________________

Project Wetlands: Aerial Miles from TNW: ________________________

Flow is From: ________________________

Estimate approximate Location of Wetland within Floodplain: ________________________
(ii) Chemical Characteristics:
Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).
Explain
Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

☐ Riparian Buffer Characteristics (type, average width): 

☐ Vegetation type/percent cover. Explain: 

Habitat for:

☐ Federally Listed Species Explain: 

☐ Fish/Spawn Areas Explain: 

☐ Other environmentally-sensitive species Explain: 

☐ Aquatic/Wildlife Diversity Explain: 

3. Characteristics of all wetlands adjacent to the tributary (if any)
All wetland(s) being considered in cumulative analysis: 

Wetland acres in total being considered in cumulative analysis: 

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions): 

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.
Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- [ ] TNWs
- [ ] Wetlands adjacent to TNWs

2. RPWs that flow directly or indirectly into TNWs

- [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

- [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

  Provide estimates for jurisdictional waters in the review area (check all that apply):

  - [ ] Tributary waters
  - [ ] Other non-wetland waters

3. Non-RPWs that flow directly or indirectly into TNWs.

- [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.

  Provide estimates of jurisdictional waters within the review area (check all that apply):

  Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

  - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

  - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:

  Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

  Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): _____ Acres: _____

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams):  linear feet: _____ width (ft): _____
☐ Other Non-wetland Waters MBR acres: _____
☐ Wetlands MBR acres: _____

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 679.52 linear feet (ft), 3.83 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

- [ ] Office (Desk) Determination. Date: [ ]
- [✓] Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There [ ] "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

- [ ] Waters subject to the ebb and flow of the tide.
- [ ] Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There [ ] "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      - [ ] TNWs (new)
      - [ ] Wetlands adjacent to TNWs
      - [ ] Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      - [ ] Non-RPWs that flow directly or indirectly into TNWs
      - [ ] Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      - [ ] Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      - [ ] Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      - [ ] Impoundments of jurisdictional waters
      - [ ] Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      - Non-Wetlands waters [ ] Linear Feet [ ] Width (ft) and/or [ ] Acres
      - Wetlands Acres: [ ]

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   - [✓] Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW: ___________________________ ☐ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

(i) General Area Conditions:

<table>

(ii) Physical Characteristics:

(a) Relationship with TNW

☐ Tributary flows directly to TNW
☑ Tributary flows through ______ tributaries before entering TNW

Project waters are ______ river miles from TNW
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
Average Width (ft):
Average Depth (ft):
Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Cobbles
- Bedrock
- Sands
- Concrete
- Gravel
- Substrate - Vegetation
- Muck
Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:
Subsurface Flow: No Explain:

Dye (or other) test performed:

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community
Other (list):

Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by:
- Mean High water Mark indicated by:
- oil or scum line along shore objects
- fine shell or debris deposits (foreshore)
- physical markings/characteristics
- tidal gauges
- other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

- □ Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

☐ TNWs Linear Feet: Width (ft): TNW Acres

☐ Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs

☐ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and rationale indicating that tributary is perennial:

☐ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

Provide estimates for jurisdictional waters in the review area (check all that apply):

☐ Tributary waters Linear Feet: Width (Ft).

☐ Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

☐ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.

Provide estimates of jurisdictional waters within the review area (check all that apply):

Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

☐ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

☐ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

☐ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:

Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

☐ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet):          Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section III C.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams):  linear feet : width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters  linear feet (ft), width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☒ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW: ____________________________

☐ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary, then it requires a significant nexus evaluation.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs Linear Feet: Width (ft): TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: Width (Ft).
       - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres): ___________

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: ___________

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale: ___________

Length (linear feet): ___________

Acres: ___________

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters ___________

Explain finding of no Significant Nexus: See Section III.C.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: ___________ width (ft): ___________
- Other Non-wetland Waters MBR acres: ___________
- Wetlands MBR acres: ___________

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters: ___________ linear feet (ft), ___________ width (ft)
- Other waters: ___________ acres
- Wetlands: ___________ acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

**SECTION II: SUMMARY OF FINDINGS**

**A. RHA SECTION 10 DETERMINATION OF JURISDICTION**

There **Are No** "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

**B. CWA SECTION 404 DETERMINATION OF JURISDICTION**

There **Are No** "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands
   
   b. Identify (estimate) size of waters of the U.S. in the review area
      
      Non-Wetlands waters: Linear Feet Width (ft) and/or Acres
      Wetlands Acres:  
   
   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain:  
Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

   Identify TNW: 
   [ ] Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

   This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

   The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

   A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

   If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

   1. Characteristics of non-TNWs that flow directly or indirectly into TNW

      (i) General Area Conditions:

         Watershed Size (sq mi): 49650
         Drainage Area (sq mi): 0.01275
         Average Annual Rainfall (in): 10
         Average Annual Snowfall (in): 0

      (ii) Physical Characteristics:

         (a) Relationship with TNW

            [ ] Tributary flows directly to TNW
            [ ] Tributary flows through [4] tributaries before entering TNW

            Project waters are [30 (or more)] river miles from TNW
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:
Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics
Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
Average Width (ft):
Average Depth (ft):
Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- [ ] Silts

  - Aquatic/Wildlife Diversity   Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely deterministic of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs
   - Linear Feet: Width (ft): TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: Width (Ft).
       - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
       - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres): 

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

Non wetland-Waters (i.e., rivers, streams): linear feet : width (ft):
Other Non-wetland Waters MBR acres:
Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

Non-wetland waters linear feet (ft), width (ft)
Other waters acres
Wetlands acres

**SECTION I: BACKGROUND INFORMATION**

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 36  
State: AZ  
County/Parish/borough: Pinal  
City: N/A

Center coordinates of site:  
Lat. 32.8482°N  
Long. -111.2599°W

Name of nearest waterbody:  
Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request  
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)  
☐ Office (Desk) Determination. Date:  
☑ Field Determination. Date(s): 10/2012

**SECTION II: SUMMARY OF FINDINGS**

A. RHA SECTION 10 DETERMINATION OF JURISDICTION  
There are no "Navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION  
There are no "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.  
a. Indicate presence of water of U.S. in review area (Check all the apply):  
☐ TNWs (new)  
☐ Wetlands adjacent to TNWs  
☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
☐ Non-RPWs that flow directly or indirectly into TNWs  
☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
☐ Impoundments of jurisdictional waters  
☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area  
Non-Wetlands waters: Linear Feet Width (ft) and/or Acres  
Wetlands Acres:

c. Limits (boundaries) of Jurisdiction based on:  

2. Non-Regulated Waters/Wetlands (check if applicable):  
☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:  
Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   Identify TNW:  
   □ Vegetation
   
   Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. **Characteristics of non-TNWs that flow directly or indirectly into TNW**

   (i) **General Area Conditions:**

   (ii) **Physical Characteristics:**

   (a) **Relationship with TNW**
   
   - □ Tributary flows directly to TNW
   - ✔ Tributary flows through 4 tributaries before entering TNW
   
   Project waters are 30 (or more) river miles from TNW
APPROVED JURISDICTIONAL DETERMINATION FORM
U.S Army Corps of Engineers

Project waters are river Miles from tributary to RPW: 
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: 
Project waters are aerial (straight) miles from tributary to RPW: 
Project waters cross or serve as state boundaries. Explain: 

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

<table>
<thead>
<tr>
<th>Tributary is: Natural</th>
<th>Explain:</th>
</tr>
</thead>
</table>

Tributary properties with respect to top of bank (estimate):
- Average Width (ft): 
- Average Depth (ft): 
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- [ ] Silts
- [ ] Sands
- [ ] Concrete
- [ ] Muck
- [ ] Cobble
- [ ] Gravel
- [ ] Substrate - Vegetation
- Other, Explain: 

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics: 
Subsurface Flow: No Explain: 

Dye (or other) test performed: 

Tributary Has (Check all that apply):

- [ ] Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- [ ] TNWs  Linear Feet:  Width (ft):  TNW Acres
- [ ] Wetlands adjacent to TNWs:  Acres:

2. RPWs that flow directly or indirectly into TNWs

- [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

- [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

   - Provide estimates for jurisdictional waters in the review area (check all that apply):
     - [ ] Tributary waters  Linear Feet:  Width (ft).
     - [ ] Other non-wetland waters:  Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

- [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.

   Provide estimates of jurisdictional waters within the review area (check all that apply):

   - Length (Linear Feet):  Width (feet):  Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  
  - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

  - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW

   Provide acreage estimates for jurisdictional wetland in the review area:  Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

   Provide acreage estimates for jurisdictional wetland in the review area:  Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet):  
Acres:  

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet:  
  width (ft):  

- Other Non-wetland Waters MBR acres:  

- Wetlands MBR acres:  

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters linear feet (ft),  
  width (ft)  

- Other waters acres  

- Wetlands acres

SECTION IV: DATA SOURCES

### D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

- Office (Desk) Determination. Date: 
- Field Determination. Date(s): 10/2012

### SECTION II: SUMMARY OF FINDINGS

**A. RHA SECTION 10 DETERMINATION OF JURISDICTION**

There **Are No** "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

- Waters subject to the ebb and flow of the tide.
- Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

**B. CWA SECTION 404 DETERMINATION OF JURISDICTION**

There **Are No** "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      - TNWs (new)
      - Wetlands adjacent to TNWs
      - Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      - Non-RPWs that flow directly or indirectly into TNWs
      - Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      - Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      - Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      - Impoundments of jurisdictional waters
      - Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      - Non-Wetlands waters [Linear Feet] Width (ft) and/or [Acres]
      - Wetlands Acres: [ ]

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   - Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
     - Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: 
   - ☐ Vegetation
   - Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   - Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

A wetland that is adjacent to but that does not directly abut an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
   - Watershed Size (sq mi): 49650
   - Drainage Area (sq mi): 1.02584
   - Average Annual Rainfall (in): 10
   - Average Annual Snowfall (in): 0
   
   (ii) Physical Characteristics:
   (a) Relationship with TNW
   - ☑ Tributary flows directly to TNW
   - ☐ Tributary flows through 4 tributaries before entering TNW
   - Project waters are 30 (or more) river miles from TNW
(b) General Tributary Characteristics

Tributary is: Natural
Explain:

Tributary properties with respect to top of bank (estimate):
- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Cobbles
- Bedrock
- Sands
- Concrete
- Gravel
- Substrate - Vegetation
- Muck
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined
Characteristics:

Subsurface Flow: No
Explain:

Dye (or other) test performed:

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community

Other (list):

3. Characteristics of all wetlands adjacent to the tributary  (if any)
All wetland(s) being considered in cumulative analysis: 
Wetland acres in total being considered in cumulative analysis: 
Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION
A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.
Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
* Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
* Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
* Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
* Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.
Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

### D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

<table>
<thead>
<tr>
<th>TNWs</th>
<th>Linear Feet:</th>
<th>Width (ft):</th>
<th>TNW Acres</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wetlands adjacent to TNWs:</td>
<td>Acres:</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: 
- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
  - Provide estimates for jurisdictional waters in the review area (check all that apply):
    - Tributary waters: Linear Feet: Width (ft).
    - Other non-wetland waters: Acres: 

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
  - Provide estimates of jurisdictional waters within the review area (check all that apply):
    - Length (Linear Feet): Width (feet): Acres: 

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres: 

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres: 

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
☐ Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet):  Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams):  linear feet :  width (ft):

☐ Other Non-wetland Waters MBR acres:

☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters  2056.27 linear feet,  51.69 width (ft)

☐ Other waters acres

☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION  

There are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION  

There are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________________ □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.08658
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
      (a) Relationship with TNW
         □ Tributary flows directly to TNW
         ☑ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
**APPROVED JURISDICTIONAL DETERMINATION FORM**

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and rationale indicating that tributary is perennial:

- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

  Provide estimates for jurisdictional waters in the review area (check all that apply):
  - Tributary waters: Linear Feet: Width (Ft).
  - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.

  Provide estimates of jurisdictional waters within the review area (check all that apply):

  Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:

  Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

  Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): [ ] Acres: [ ]

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non-wetland-Waters (i.e., rivers, streams): linear feet: [ ] width (ft): [ ]
☐ Other Non-wetland Waters MBR acres: [ ]
☐ Wetlands MBR acres: [ ]

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☒ Non-wetland waters linear feet (ft), 1777.09 width (ft), 14.81 acres
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

Additional Comments to Support JD:
SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 39  
State: AZ  
County/Parish/borough: Pinal County  
City: N/A  
Center coordinates of site: Lat. 32.8482°N  
Long. -111.2599°W  
Name of nearest waterbody:  
Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: 
Gila River between Powers Butte and Gillespie Dam  
Name of watershed or Hydrologic Unit Code (HUC): 15050100  
☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request  
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICATION  
There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICATION  
There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.  
   a. Indicate presence of water of U.S. in review area (Check all the apply):  
      □ TNWs (new)  
      □ Wetlands adjacent to TNWs  
      □ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
      □ Non-RPWs that flow directly or indirectly into TNWs  
      □ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
      □ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
      □ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
      □ Impoundments of jurisdictional waters  
      □ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area  
      Non-Wetlands waters __________ Linear Feet  
      Width (ft) and/or __________ Acres  
      Wetlands Acres: __________

   c. Limits (boundaries) of Jurisdiction based on:  

2. Non-Regulated Waters/Wetlands (check if applicable):  
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:  
   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: _______________________
   □ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   | Watershed Size (sq mi):  | 49650 |
   | Drainage Area (sq mi):   | 46.18638 |
   | Average Annual Rainfall (in): | 10 |
   | Average Annual Snowfall (in): | 0 |

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   □ Tributary flows directly to TNW
   ✔ Tributary flows through 4 tributaries before entering TNW

   Project waters are 30 (or more) river miles from TNW
(b) General Tributary Characteristics

Tributary is: Natural   Explain:

Tributary properties with respect to top of bank (estimate):
- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Bedrock
- Gravel
- Substrate - Vegetation
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.]

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined   Characteristics:

Subsurface Flow: No   Explain:

☐ Dye (or other) test performed:

Tributary Has (Check all that apply):

☐ Bed and Banks

☐ OHWM (check all the apply): OHWM Indicators:
- Clear, natural line impressed on the bank
- Changes in soil character
- Shelving
- Vegetation matted down, bent or absent
- Leaf litter disturbed or washed away
- Sediment deposition
- Water staining
- Presence of litter and debris
- Destruction of terrestrial vegetation
- Presence of wrack line
- Sediment sorting
- Scour
- Multiple observed or predicted flow events
- Abrupt change in plant community

Other (list):

☐ Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: ____________________________
- Mean High water Mark indicated by: ____________________
- oil or scum line along shore objects
- fine shell or debris deposits (foreshore)
- physical markings/characteristics
- tidal gauges
- other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: ____________________________________________

Identify Specific Pollutants, if known: ______________________

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: ______________________
- Wetland Fringe Characteristics: _______________________

Habitat for:

- Federally Listed Species Explain findings: ______________
- Fish/Spawn Areas Explain findings: _____________________
- Other environmentally -sensitive species Explain findings: ______________
- Aquatic/Wildlife diversity Explain: _____________________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac): ____________________________
- Wetland Type, Explain: _______________________
- Wetland Quality, Explain: ______________________

Project Wetlands Cross or Serve as State Boundaries, Explain: ______________________

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: ____________________________

Surface Flow is: ____________________________

Characteristics: ____________________________

Subsurface Flow: ____________________________

Explain Findings: ____________________________

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW
  - Discrete wetland hydrologic connection Explain: ______________________
  - Ecological connection Explain: ______________________
  - Separated by berm/barrier Explain: ______________________

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: ______________________

Project Wetlands: Aerial Miles from TNW: ______________________

Flow is From: ____________________________

Estimate approximate Location of Wetland within Floodplain: ______________________
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if known:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer  Characteristics (type, average width):
- Vegetation  type/percent cover. Explain:

Habitat for:
- Federally Listed Species  Explain:
- Fish/Spawn Areas  Explain:
- Other environmentally-sensitive species  Explain:
- Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?: size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs
   - Wetlands adjacent to TNWs

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters
       - Other non-wetland waters

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet):
     - Width (feet):
     - Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW
   - Provide acreage estimates for jurisdictional wetland in the review area:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
   - Provide acreage estimates for jurisdictional wetland in the review area:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional wetlands.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): ______________ Acres: ______________

F. NON‐JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: ______________ width (ft): ______________
☐ Other Non-wetland Waters MBR acres: ______________
☐ Wetlands MBR acres: ______________

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters acres: ______________ linear feet (ft), 1805.60 width (ft) 24.16
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

### SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters Linear Feet Width (ft) and/or Acres

      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.10474
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         □ Tributary flows directly to TNW
         ☑ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
### (b) General Tributary Characteristics

Tributary is: Natural

<table>

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?, size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs Linear Feet: ___________________ Width (ft): _______ TNW Acres _______
   - Wetlands adjacent to TNWs: Acres: _______

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: ___________________
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: ___________________
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: _______ Width (Ft): _______ Acres: _______
       - Other non-wetland waters: Acres: _______

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet): _______ Width (feet): _______ Acres: _______

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: ___________________
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: ___________________
       - Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet : width (ft):
☐ Other Non-wetland Waters MBR acres:
☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters linear feet (ft), width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 40

State: AZ  
County/Parish/borough: Pinal  
City: N/A

Center coordinates of site: Lat. 32.8482°N Long. -111.2599°W

Name of nearest waterbody:

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:

Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date: 
☐ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There ☐ Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There ☐ Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):

☐ TNWs (new)
☐ Wetlands adjacent to TNWs
☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
☐ Non-RPWs that flow directly or indirectly into TNWs
☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
☐ Impoundments of jurisdictional waters
☐ Isolated ( interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

Non-Wetlands waters Linear Feet Width (ft) and/or Acres

Wetlands Acres:

c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: 
   - ☐ Vegetation
   - Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   - Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   - (i) General Area Conditions:
     - Watershed Size (sq mi): 49650
     - Drainage Area (sq mi): 0.10472
     - Average Annual Rainfall (in): 10
     - Average Annual Snowfall (in): 0
   - (ii) Physical Characteristics:
     - ☐ Tributary flows directly to TNW
     - ✅ Tributary flows through 4 tributaries before entering TNW
     - Project waters are 30 (or more) river miles from TNW
(b) General Tributary Characteristics

Tributary is: Natural

Tributary properties with respect to top of bank (estimate):
- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sand
- Concrete
- Muck
- Cobble
- Gravel
- Substrate - Vegetation
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined

Subsurface Flow: No

Dye (or other) test performed:

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all that apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community
- Other (list):

Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- [ ] High tide line indicated by:
- [ ] oil or scum line along shore objects
- [ ] fine shell or debris deposits (foreshore)
- [ ] physical markings/characteristics
- [ ] tidal gauges
- [ ] other

- [ ] Mean High water Mark indicated by:
- [ ] survey to available datum
- [ ] physical markings
- [ ] vegetation lines/changes in vegetation types

(iii) Chemical Characteristics:
Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):
Explain:
Identify Specific Pollutants, if known:

(iv) Biological Characteristics. Channel supports (check all that apply):

- [ ] Wetland Fringe  Characteristics:
Habitat for:
- [ ] Federally Listed Species  Explain findings:
- [ ] Fish/Spawn Areas  Explain findings:
- [ ] Other environmentally -sensitive species  Explain findings:
- [ ] Aquatic/Wildlife diversity  Explain:

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:
(a) General Wetland Characteristics
Properties:
- Wetland Size (ac):
- Wetland Type, Explain:
- Wetland Quality, Explain:

Project Wetlands Cross or Serve as State Boundaries, Explain:

(b) General Flow Relationship with Non-TNW:
- Wetland Flow is: Explain:
- Surface Flow is:
  Characteristics:
- Subsurface Flow: Explain Findings:

(c) Wetland Adjacency Determination with Non-TNW:
- [ ] Wetland Directly Abutting Non-TNW
- [ ] Wetland Not Directly Abutting Non-TNW
  - [ ] Discrete wetland hydrologic connection  Explain:
  - [ ] Ecological connection  Explain:
  - [ ] Separated by berm/barrier  Explain:

(d) Proximity (Relationship) to TNW
- Project Wetlands: River Miles from TNW:
- Project Wetlands: Aerial Miles from TNW:
- Flow is From:
- Estimate approximate Location of Wetland within Floodplain:
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- [ ] Riparian Buffer Characteristics (type, average width):
- [ ] Vegetation type/percent cover. Explain:

Habitat for:

- [ ] Federally Listed Species Explain:
- [ ] Fish/Spawn Areas Explain:
- [ ] Other environmentally-sensitive species Explain:
- [ ] Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical, and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g., between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- TNWs Linear Feet: Width (ft): TNW Acres
- Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

  Provide estimates for jurisdictional waters in the review area (check all that apply):

  - Tributary waters Linear Feet: Width (Ft).
  - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.

  Provide estimates of jurisdictional waters within the review area (check all that apply):

  Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:

  Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

  Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters
Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters linear feet (ft), width (ft):
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

   ☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICATION
   There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.
   ☐ Waters subject to the ebb and flow of the tide.
   ☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICATION
   There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.
   1. Waters of the U.S.
      a. Indicate presence of water of U.S. in review area (Check all the apply):
         ☐ TNWs (new)
         ☐ Wetlands adjacent to TNWs
         ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
         ☐ Non-RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
         ☐ Impoundments of jurisdictional waters
         ☐ Isolated (interstate or intrastate) waters, including isolated wetlands
      b. Identify (estimate) size of waters of the U.S. in the review area
         Non-Wetlands waters Linear Feet Width (ft) and/or Acres
         Wetlands Acres:
      c. Limits (boundaries) of Jurisdiction based on:
   2. Non-Regulated Waters/Wetlands (check if applicable):
      ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________ □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.07461
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
      □ Tributary flows directly to TNW
      ✔ Tributary flows through ☻ tributaries before entering TNW
      Project waters are 30 (or more) river miles from TNW
**Feature ID:** 41

**Project waters are**
- river Miles from tributary to RPW:
- Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
- Project waters are aerial (straight) miles from tributary to RPW:
- Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?, size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands.  Check all that apply and provide size estimates in review area:

   - TNWs  Linear Feet:     Width (ft):  TNW Acres
   - Wetlands adjacent to TNWs:  Acres:

2. RPWs that flow directly or indirectly into TNWs

   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

     Provide estimates for jurisdictional waters in the review area (check all that apply):

     - Tributary waters  Linear Feet:  Width (ft).
     - Other non-wetland waters:  Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.

     Provide estimates of jurisdictional waters within the review area (check all that apply):

     Length (Linear Feet):  Width (feet):  Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:

     Provide acreage estimates for jurisdictional wetland in the review area:  Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

     Provide acreage estimates for jurisdictional wetland in the review area:  Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C..

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): ______ Acres: ______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- [ ] Non-wetland-Waters (i.e., rivers, streams): linear feet: ______ width (ft): ______
- [ ] Other Non-wetland Waters MBR acres: ______
- [ ] Wetlands MBR acres: ______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- [x] Non-wetland waters 1326.98 linear feet, 10.12 width (ft)
- [ ] Other waters acres
- [ ] Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There ☐ Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.
☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There ☐ Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW:  
   - [ ] Vegetation
   - Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   - Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) **General Area Conditions:**
   - Watershed Size (sq mi): 49650
   - Drainage Area (sq mi): 0.01273

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis: 

Wetland acres in total being considered in cumulative analysis: 

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions): 

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. 

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. **TNWs and Adjacent Wetlands.** Check all that apply and provide size estimates in review area:
   - [ ] TNWs Linear Feet: _______ Width (ft): _______ TNW Acres _______
   - [ ] Wetlands adjacent to TNWs: Acres: _______

2. **RPWs that flow directly or indirectly into TNWs**
   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: _______
   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: _______
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - [ ] Tributary waters Linear Feet: _______ Width (Ft): _______ Acres: _______
       - [ ] Other non-wetland waters: Acres: _______

3. **Non-RPWs that flow directly or indirectly into TNWs.**
   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet): _______ Width (feet): _______ Acres: _______

4. **Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.**
   - [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: _______
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: _______
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

5. **Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW**
   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

6. **Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.**
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: __________________

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329 in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres: 

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW:

☐ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary adjacent to wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for all onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.07426
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

      (a) Relationship with TNW

      ☐ Tributary flows directly to TNW
      ☑ Tributary flows through 4 tributaries before entering TNW

      Project waters are 30 (or more) river miles from TNW
**Feature ID:** AP43

Project waters are river Miles from tributary to RPW: 

<table>

  - Aquatic/Wildlife Diversity

Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

   - TNWs    Linear Feet:     Width (ft):     TNW Acres
   - Wetlands adjacent to TNWs:   Acres:

2. RPWs that flow directly or indirectly into TNWs

   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

     Provide estimates for jurisdictional waters in the review area (check all that apply):

     - Tributary waters    Linear Feet:    Width (Ft).
     - Other non-wetland waters:   Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.

     Provide estimates of jurisdictional waters within the review area (check all that apply):

     Length (Linear Feet):     Width (feet):    Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW

     Provide acreage estimates for jurisdictional wetland in the review area:   Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

     Provide acreage estimates for jurisdictional wetland in the review area:   Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): ______ Acres: ______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: ______ width (ft): ______
☐ Other Non-wetland Waters MBR acres: ______
☐ Wetlands MBR acres: ______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 717.40 linear feet (ft), 4.80 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD) July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 44

State: AZ  County/Parish/borough: Pinal County  City: N/A

Center coordinates of site: Lat. 32.8482°N  Long. -111.2599°W

Name of nearest waterbody:

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination.  Date: 
☑ Field Determination.  Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There are no "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There are no "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: [ ] Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 1.47836
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         □ Tributary flows directly to TNW
         ✓ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
**Feature ID**: APPROVED JURISDICTIONAL DETERMINATION FORM
U.S Army Corps of Engineers

Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

### (b) General Tributary Characteristics

<table>
<thead>
<tr>
<th>Tributary is: Natural</th>
<th>Explain:</th>
</tr>
</thead>
</table>

Tributary properties with respect to top of bank (estimate):
- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Cobble
- Gravel
- Substrate - Vegetation
- Other, Explain: Stable.

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

### (c) Flow:

<table>
<thead>
<tr>
<th>Tributary Provides for: Ephemeral Flow</th>

</thead>
</table>

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.
Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics: 
Subsurface Flow: No Explain:

☐ Dye (or other) test performed:

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community

Other (list):

☐ Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):
- High tide line indicated by: ______________________________________
- Mean High water Mark indicated by: ________________
  - oil or scum line along shore objects
  - fine shell or debris deposits (foreshore)
  - physical markings/characteristics
  - tidal gauges
  - other
- survey to available datum
- physical markings
- vegetation lines/changes in vegetation types

(iii) Chemical Characteristics:
Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):
Explain: __________________________________________________________
Identify Specific Pollutants, if known:
__________________________________________________________________

(iv) Biological Characteristics. Channel supports (check all that apply):
- Riparian Corridor Characteristics: _________________________________
- Wetland Fringe Characteristics: _________________________________
Habitat for:
- Federally Listed Species Explain findings: ____________________________
- Fish/Spawn Areas Explain findings: ________________________________
- Other environmentally -sensitive species Explain findings: ____________
- Aquatic/Wildlife diversity Explain: _________________________________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:
(a) General Wetland Characteristics
Properties:
  - Wetland Size (ac): ______________________________
  - Wetland Type, Explain: ____________________________
  - Wetland Quality, Explain: __________________________
Project Wetlands Cross or Serve as State Boundaries, Explain: ________________

(b) General Flow Relationship with Non-TNW:
Wetland Flow is: ________________ Explain: __________________________
Surface Flow is: ________________
  - Characteristics: _____________________________________________
Subsurface Flow: ______________________ Explain Findings: ____________

(c) Wetland Adjacency Determination with Non-TNW:
- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW
  - Discrete wetland hydrologic connection Explain: ____________________
  - Ecological connection Explain: _________________________________
  - Separated by berm/barrier Explain: ______________________________

(d) Proximity (Relationship) to TNW
Project Wetlands: River Miles from TNW: _____________________________
Project Wetlands: Aerial Miles from TNW: ____________________________
Flow is From: _____________________________________________________
Estimate approximate Location of Wetland within Floodplain: ______________
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if known:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer
  - Characteristics (type, average width):
  - Habitat for:
    - Federally Listed Species
    - Fish/Spawn Areas
    - Other environmentally-sensitive species
    - Aquatic/Wildlife Diversity

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?, size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

   - TNWs Linear Feet: Width (ft): TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs

   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: Width (Ft).
       - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
       - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: ________________________

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale: ________________________
Length (linear feet): _______ Acres: _______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters: ________________________

Explain finding of no Significant Nexus: See Section III C.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: _______ width (ft): _______
- Other Non-wetland Waters MBR acres: _______
- Wetlands MBR acres: _______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters 1755.74 linear feet (ft), 8.79 width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

**SECTION II: SUMMARY OF FINDINGS**

**A. RHA SECTION 10 DETERMINATION OF JURISDICTION**

There **Are No** "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329 in the review area.

- Waters subject to the ebb and flow of the tide.
- Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

**B. CWA SECTION 404 DETERMINATION OF JURISDICTION**

There **Are No** "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   - a. Indicate presence of water of U.S. in review area (Check all the apply):
     - TNWs (new)
     - Wetlands adjacent to TNWs
     - Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
     - Non-RPWs that flow directly or indirectly into TNWs
     - Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
     - Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
     - Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
     - Impoundments of jurisdictional waters
     - Isolated (interstate or intrastate) waters, including isolated wetlands
   - b. Identify (estimate) size of waters of the U.S. in the review area
     - Non-Wetlands waters
     - Linear Feet
     - Width (ft) and/or
     - Acres
     - Wetlands Acres
   - c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

- Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

  **Explain:** Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: [ ]
   - Vegetation [ ]
   - Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   - Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   - **(i) General Area Conditions:**
     - Watershed Size (sq mi): 49650
     - Drainage Area (sq mi): 0.13651
     - Average Annual Rainfall (in): 10
     - Average Annual Snowfall (in): 0
   - **(ii) Physical Characteristics:**
     - **(a) Relationship with TNW**
       - Tributary flows directly to TNW [ ]
       - Tributary flows through [ ]
       - Tributaries before entering TNW [ ]
       - Project waters are [ ] river miles from TNW [ ]

2. Characteristics of wetlands adjacent to TNW
Project waters are river Miles from tributary to RPW: 
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: 
Project waters are aerial (straight) miles from tributary to RPW: 
Project waters cross or serve as state boundaries. Explain: 

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics
Tributary is: Natural Explain: 

Tributary properties with respect to top of bank (estimate):
Average Width (ft): 
Average Depth (ft): 
Average Side Slopes: 3:1 

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Cobble
- Gravel
- Substrate - Vegetation
- Other, Explain: 

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.
Presence of Run/Riffle/Pool Complexes. Explain: Not present.
Tributary Geometry: Relatively Straight 
Tributary Gradient (approximate average slope): 1%

(c) Flow:
Tributary Provides for: Ephemeral Flow 
Estimate average number of flow events in review area/year: 2-5

3. Characteristics of all wetlands adjacent to the tributary (if any)

- [ ] All wetland(s) being considered in cumulative analysis:

- [ ] Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

   Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

   This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- [ ] TNWs
- Width: __________
- TNW Acres: __________
- [ ] Wetlands adjacent to TNWs: Acres: __________

2. RPWs that flow directly or indirectly into TNWs

- [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: __________
- [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: __________
  - Provide estimates for jurisdictional waters in the review area (check all that apply):
    - [ ] Tributary waters
    - Linear Feet: __________
    - Width (Ft.): __________
    - [ ] Other non-wetland waters:
    - Acres: __________

3. Non-RPWs that flow directly or indirectly into TNWs.

- [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
  - Provide estimates of jurisdictional waters within the review area (check all that apply):
    - Length (Linear Feet): __________
    - Width (feet): __________
    - Acres: __________________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: __________
  - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: __________
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON‐JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non‐Jurisdictional Waters

Provide acreage estimates for non‐jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland‐Waters (i.e., rivers, streams): linear feet: width (ft):
☐ Other Non‐wetland Waters MBR acres:
☐ Wetlands MBR acres:

Provide acreage estimates for non‐jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non‐wetland waters linear feet (ft), width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

Additional Comments to Support JD:
SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 46

State: AZ  
County/Parish/borough: Pinal County  
City: N/A

Center coordinates of site: Lat. 32.8482°N, Long. -111.2599°W

Name of nearest waterbody:

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:
Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction as defined by 33 CFR part 329 in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction as defined by 33 CFR part 328 in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1; only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1; otherwise, see Section III.B below.

1. TNW

   Identify TNW: 
   □ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a TNW that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.17965
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   □ Tributary flows directly to TNW
   ☑ Tributary flows through 4 tributaries before entering TNW

   Project waters are 30 (or more) river miles from TNW

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- TNWs  Linear Feet: __________  Width (ft): __________  TNW Acres: __________
- Wetlands adjacent to TNWs: Acres: __________

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: __________
- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: __________
  Provide estimates for jurisdictional waters in the review area (check all that apply):
  - Tributary waters  Linear Feet: __________  Width (ft): __________
  - Other non-wetland waters: Acres: __________

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
  Provide estimates of jurisdictional waters within the review area (check all that apply):
  Length (Linear Feet): __________  Width (feet): __________  Acres: __________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: __________
  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: __________
  Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
  Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

7. Impoundments of jurisdictional waters.

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non-wetland-Waters (i.e., rivers, streams): linear feet: ______ width (ft): ______
- Other Non-wetland Waters MBR acres: ______
- Wetlands MBR acres: ______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters linear feet (ft), 1613.74 10.30 width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

APPROVED JURISDICTIONAL DETERMINATION FORM

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)
   July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER
   Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:
   Drainage Feature 47
   State: AZ
   County/Parish/borough: Pinal
   City: N/A
   Center coordinates of site: Lat. 32.8482°N Long. -111.2599°W
   Name of nearest waterbody:
   Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:
     Gila River between Powers Butte and Gillespie Dam
   Name of watershed or Hydrologic Unit Code (HUC): 15050100
   ☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
   ☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)
   ☐ Office (Desk) Determination. Date: 
   ☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION
   There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.
   ☐ Waters subject to the ebb and flow of the tide.
   ☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION
   There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.
   1. Waters of the U.S.
      a. Indicate presence of water of U.S. in review area (Check all the apply):
         ☐ TNWs (new)
         ☐ Wetlands adjacent to TNWs
         ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
         ☐ Non-RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
         ☐ Impoundments of jurisdictional waters
         ☐ Isolated (interstate or intrastate) waters, including isolated wetlands
      b. Identify (estimate) size of waters of the U.S. in the review area
         Non-Wetlands waters _______ Linear Feet _______ Width (ft) and/or _______ Acres
         Wetlands Acres: _______
      c. Limits (boundaries) of Jurisdiction based on:
   2. Non-Regulated Waters/Wetlands (check if applicable):
      ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
         Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW:

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.04962
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
      (a) Relationship with TNW
         □ Tributary flows directly to TNW
         ✓ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
**Feature ID:** 47

**APPROVED JURISDICTIONAL DETERMINATION FORM**

**U.S. Army Corps of Engineers**

Project waters are [ ] river
Miles from tributary to RPW: ______________

Project waters are [ ] 30 (or more) aerial (straight) miles from tributary to RPW: ______________

Project waters are [ ] 30 (or more) aerial (straight) miles from tributary to TNW: ______________

Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

### (b) General Tributary Characteristics

<table>
<thead>
<tr>
<th>Tributary is:</th>
<th>Natural</th>
<th>Explain:</th>
</tr>
</thead>
</table>

**Tributary properties with respect to top of bank (estimate):**

- Average Width (ft): ______________
- Average Depth (ft): ______________
- Average Side Slopes: 3:1

**Primary tributary substrate composition (check all that apply):**

- [ ] Silts
- [ ] Sands
- [ ] Concrete
- [ ] Muck
- [ ] Cobbles
- [ ] Gravel
- [ ] Substrate - Vegetation
- Other, Explain: ______________

**Tributary Condition/Stability** [e.g., highly eroding, sloughing banks. Explain: Stable.]

**Presence of Run/Riffle/Pool Complexes. Explain:** Not present.

**Tributary Geometry:** Relatively Straight

**Tributary Gradient (approximate average slope):** 1%

### (c) Flow:

**Tributary Provides for:** Ephemeral Flow

**Estimate average number of flow events in review area/year:** 2-5

**Describe Flow Regime:** Ephemeral.

**Other Information on Duration and Volume:** ______________

**Surface Flow is:** Discrete and Confined

**Subsurface Flow:** No

**Dye (or other) test performed:** ______________

**Tributary Has (Check all that apply):**

- [ ] Bed and Banks
- [ ] OHWM (check all the apply): OHWM Indicators:
  - [ ] Clear, natural line impressed on the bank
  - [ ] Changes in soil character
  - [ ] Shelving
  - [ ] Vegetation matted down, bent or absent
  - [ ] Leaf litter disturbed or washed away
  - [ ] Sediment deposition
  - [ ] Water staining
  - [ ] Presence of litter and debris
  - [ ] Destruction of terrestrial vegetation
  - [ ] Presence of wrack line
  - [ ] Sediment sorting
  - [ ] Scour
  - [ ] Multiple observed or predicted flow events
  - [ ] Abrupt change in plant community

**Other (list):** ______________

**Discontinuous? Explain:** ______________
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: [ ]
- Oil or scum line along shore objects [ ]
- Fine shell or debris deposits (foreshore) [ ]
- Physical markings/characteristics [ ]
- Tidal gauges [ ]
- Other [ ]

- Mean High water Mark indicated by: [ ]
- Survey to available datum [ ]
- Physical markings [ ]
- Vegetation lines/changes in vegetation types [ ]

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: [ ]

Identify Specific Pollutants, if known: [ ]

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: [ ]
- Wetland Fringe Characteristics: [ ]

Habitat for:

- Federally Listed Species Explain findings: [ ]
- Fish/Spawn Areas Explain findings: [ ]
- Other environmentally-sensitive species Explain findings: [ ]
- Aquatic/Wildlife diversity Explain: [ ]

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac): [ ]
- Wetland Type, Explain: [ ]
- Wetland Quality, Explain: [ ]

Project Wetlands Cross or Serve as State Boundaries, Explain: [ ]

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: [ ]

Explain: [ ]

Surface Flow is: [ ]

Characteristics: [ ]

Subsurface Flow: [ ]

Explain Findings: [ ]

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW [ ]
- Wetland Not Directly Abutting Non-TNW [ ]

- Discrete wetland hydrologic connection Explain: [ ]
- Ecological connection Explain: [ ]
- Separated by berm/barrier Explain: [ ]

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: [ ]

Project Wetlands: Aerial Miles from TNW: [ ]

Flow is From: [ ]

Estimate approximate Location of Wetland within Floodplain: [ ]
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

☐ Riparian Buffer Characteristics (type, average width):

☐ Vegetation type/percent cover. Explain:

Habitat for:

☐ Federally Listed Species Explain:

☐ Fish/Spawn Areas Explain:

☐ Other environmentally-sensitive species Explain:

☐ Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?: size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

   Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

   This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- [ ] TNWs Linear Feet: __________ Width (ft): __________ TNW Acres __________
- [ ] Wetlands adjacent to TNWs: Acres: __________

2. RPWs that flow directly or indirectly into TNWs

- [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: __________
- [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: __________

Provide estimates for jurisdictional waters in the review area (check all that apply):

- [ ] Tributary waters Linear Feet: __________ Width (Ft): __________ Acres: __________
- [ ] Other non-wetland waters: Acres: __________

3. Non-RPWs that flow directly or indirectly into TNWs.

- [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

Provide estimates of jurisdictional waters within the review area (check all that apply):

Length (Linear Feet): __________ Width (feet): __________ Acres: __________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: __________
  - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW

Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters linear feet (ft), width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters __________ Linear Feet __________ Width (ft) and/or __________ Acres
      Wetlands Acres: __________

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: ______________________
   - □ Vegetation

   Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. **Characteristics of non-TNWs that flow directly or indirectly into TNW**

   
   (i) **General Area Conditions:**
   
   | Watershed Size (sq mi): | 49650 |
   | Drainage Area (sq mi):  | 0.03069 |
   | Average Annual Rainfall (in): | 10 |
   | Average Annual Snowfall (in): | 0 |

   (ii) **Physical Characteristics:**

   (a) **Relationship with TNW**

   - □ Tributary flows directly to TNW
   - ✔ Tributary flows through ___ tributaries before entering TNW
   - Project waters are ___ (or more) river miles from TNW
(b) General Tributary Characteristics

Tributary is: Natural

Tributary properties with respect to top of bank (estimate):
- Average Width (ft): 
- Average Depth (ft): 
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts [ ]
- Sands [ ]
- Concrete [ ]
- Muck [ ]

3. Characteristics of all wetlands adjacent to the tributary (if any)

- All wetland(s) being considered in cumulative analysis:
- Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g., between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- TNWs
- Wetlands adjacent to TNWs

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

  - Provide estimates for jurisdictional waters in the review area (check all that apply):
    - Tributary waters
    - Other non-wetland waters

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

  - Provide estimates of jurisdictional waters within the review area (check all that apply):
    - Length (Linear Feet): 
    - Width (feet):
    - Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW

    - Provide acreage estimates for jurisdictional wetland in the review area:
      - Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

    - Provide acreage estimates for jurisdictional wetland in the review area:
      - Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres): 

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: 

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet):  
Acres:  

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters  

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet:  width (ft):  
- Other Non-wetland Waters MBR acres:  
- Wetlands MBR acres:  

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters linear feet (ft),  width (ft)  
- Other waters acres  
- Wetlands acres

Long. -111.2599°W  
Name of nearest waterbody:  
Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  
Gila River between Powers Butte and Gillespie Dam  
Name of watershed or Hydrologic Unit Code (HUC): 15050100  
☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request  
☐ Check if other sites (e.g, offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)  
☐ Office (Desk) Determination. Date:  
☑ Field Determination. Date(s): 10/2012

**SECTION II: SUMMARY OF FINDINGS**

A. RHA SECTION 10 DETERMINATION OF JURISDICTION  
There ☐ Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.  
☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION  
There ☐ Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.  
   a. Indicate presence of water of U.S. in review area (Check all the apply):  
      ☐TNWs (new)  
      ☐ Wetlands adjacent to TNWs  
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
      ☐ Non-RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
      ☐ Impoundments of jurisdictional waters  
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands  

   b. Identify (estimate) size of waters of the U.S. in the review area  
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres  
      Wetlands Acres:  

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):  
☐ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:  
   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: [Blank]
   - ☐ Vegetation

   Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) **General Area Conditions:**

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.85095
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) **Physical Characteristics:**

   (a) **Relationship with TNW**

   ☐ Tributary flows directly to TNW
   ☑ Tributary flows through 4 tributaries before entering TNW

   Project waters are 30 (or more) river miles from TNW
Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural

Tributary properties with respect to top of bank (estimate):
- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Gravel
- Substrate - Vegetation
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Surface Flow is: Discrete and Confined

Subsurface Flow: No

Dye (or other) test performed:

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community

Other (list):

Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: [ ]
- oil or scum line along shore objects [ ]
- fine shell or debris deposits (foreshore) [ ]
- physical markings/characteristics [ ]
- tidal gauges [ ]
- other [ ]

- Mean High water Mark indicated by: [ ]

- physical markings [ ]
- vegetation lines/changes in vegetation types [ ]

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: [ ]

Identify Specific Pollutants, if known: [ ]

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: [ ]
- Wetland Fringe Characteristics: [ ]

Habitat for:

- Federally Listed Species Explain findings: [ ]
- Fish/Spawn Areas Explain findings: [ ]
- Other environmentally-sensitive species Explain findings: [ ]
- Aquatic/Wildlife diversity Explain: [ ]

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac): [ ]
- Wetland Type, Explain: [ ]
- Wetland Quality, Explain: [ ]

Project Wetlands Cross or Serve as State Boundaries, Explain: [ ]

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: [ ]

Surface Flow is: [ ]

- Characteristics: [ ]

Subsurface Flow: Explain Findings: [ ]

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW [ ]
- Wetland Not Directly Abutting Non-TNW [ ]

- Discrete wetland hydrologic connection Explain: [ ]
- Ecological connection Explain: [ ]
- Separated by berm/barrier Explain: [ ]

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: [ ]

Project Wetlands: Aerial Miles from TNW: [ ]

Flow is From: [ ]

Estimate approximate Location of Wetland within Floodplain: [ ]
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

☐ Riparian Buffer Characteristics (type, average width):

☐ Vegetation type/percent cover. Explain:

Habitat for:

☐ Federally Listed Species Explain:

☐ Fish/Spawn Areas Explain:

☐ Other environmentally-sensitive species Explain:

☐ Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - [ ] TNWs  Linear Feet:  Width (ft):  TNW Acres  
   - [ ] Wetlands adjacent to TNWs:  Acres:  

2. RPWs that flow directly or indirectly into TNWs
   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:  
   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:  
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - [ ] Tributary waters  Linear Feet:  Width (Ft).  Acres:  
       - [ ] Other non-wetland waters:  Acres:  

3. Non-RPWs that flow directly or indirectly into TNWs.
   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):  
       - Length (Linear Feet):  Width (feet):  Acres:  

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.  
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:  
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:  
       - Provide acreage estimates for jurisdictional wetland in the review area:  Acres:  

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area:  Acres:  

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): ______ Acres: ______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters
Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: ______ width (ft): ______
☐ Other Non-wetland Waters MBR acres: ______
☐ Wetlands MBR acres: ______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 3465.45 linear feet, 11.50 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There are No navigable waters of the U.S. within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There are No waters of the U.S. within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):

☐ TNWs (new)

☐ Wetlands adjacent to TNWs

☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs

☐ Non-RPWs that flow directly or indirectly into TNWs

☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs

☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs

☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs

☐ Impoundments of jurisdictional waters

☐ Isolated ( interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

<table>

Wetlands Acres: 

C. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ___
   □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.02046
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
   (a) Relationship with TNW
   □ Tributary flows directly to TNW
   ✔ Tributary flows through ___ tributaries before entering TNW
   Project waters are ___ (or more) river miles from TNW
Project waters are river Miles from tributary to RPW: 
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: 
Project waters are aerial (straight) miles from tributary to RPW: 
Project waters cross or serve as state boundaries. Explain: 
Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernable past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

| Tributary is: Natural | Explain: |
Tributary properties with respect to top of bank (estimate):
| Average Width (ft): |
| Average Depth (ft): |
| Average Side Slopes: 3:1 |

  - Federally Listed Species  Explain:
  - Fish/Spawn Areas  Explain:
  - Other environmentally-sensitive species  Explain:
  - Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetlands being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g., between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

   Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs Linear Feet: Width (ft): TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdicational waters in the review area (check all that apply):
       - Tributary waters Linear Feet: Width (ft).
       - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW
       - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C..

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON‐JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC.2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters linear feet, width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ___________________________  □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting the

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 1.45863
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
      (a) Relationship with TNW
         □ Tributary flows directly to TNW
         ✓ Tributary flows through ___ 4 ___ tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
(b) General Tributary Characteristics

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?

• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?

• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

   Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

   This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- TNWs
- Wetlands adjacent to TNWs

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
  - Provide estimates for jurisdictional waters in the review area (check all that apply):
    - Tributary waters
    - Other non-wetland waters

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

  Provide estimates of jurisdictional waters within the review area (check all that apply):
  - Length (Linear Feet):
  - Width (feet):
  - Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:

  Provide acreage estimates for jurisdictional wetland in the review area:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

  Provide acreage estimates for jurisdictional wetland in the review area:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION  
There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329 in  
the review area.  
☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION  
There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review  
area.  
1. Waters of the U.S.  
   a. Indicate presence of water of U.S. in review area (Check all the apply):  
      ☐ TNWs (new)  
      ☐ Wetlands adjacent to TNWs  
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
      ☐ Non-RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
      ☐ Impoundments of jurisdictional waters  
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands  
   b. Identify (estimate) size of waters of the U.S. in the review area  
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres  
      Wetlands Acres:  
   c. Limits (boundaries) of Jurisdiction based on:  
   2. Non-Regulated Waters/Wetlands (check if applicable):  
      ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:  
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   
   Identify TNW:  
   □ Vegetation
   
   Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   - Watershed Size (sq mi): 49650
   - Drainage Area (sq mi): 0.32143
   - Average Annual Rainfall (in): 10
   - Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   □ Tributary flows directly to TNW
   ✓ Tributary flows through 4 tributaries before entering TNW

   Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:  
Project waters are aerial (straight) miles from tributary to TNW:  
Project waters are aerial (straight) miles from tributary to RPW:  
Project waters cross or serve as state boundaries. Explain:  

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics
Tributary is: Natural Explain:  

Tributary properties with respect to top of bank (estimate):

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs Linear Feet: ___________ Width (ft): ___________ TNW Acres ___________
   - Wetlands adjacent to TNWs: Acres: ___________

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: ___________
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: ___________
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: ___________ Width (Ft): ___________
       - Other non-wetland waters: Acres: ___________

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet): ___________ Width (feet): ___________ Acres: ___________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: ___________
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: ___________
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: ___________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: ___________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): [___] Acres: [___]

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- [ ] Non-wetland-Waters (i.e., rivers, streams): linear feet: [___] width (ft): [___]
- [ ] Other Non-wetland Waters MBR acres: [___]
- [ ] Wetlands MBR acres: [___]

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- [x] Non-wetland waters 549.80 linear feet (ft), 8.59 width (ft)
- [ ] Other waters acres
- [ ] Wetlands acres

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in
the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):
   ☐ TNWs (new)
   ☐ Wetlands adjacent to TNWs
   ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
   ☐ Non-RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
   ☐ Impoundments of jurisdictional waters
   ☐ Isolated ( interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

   Non-Wetlands waters  Linear Feet  Width (ft) and/or  Acres

   Wetlands Acres: 

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

  Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered
jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a
significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________________ ☐ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
   - Watershed Size (sq mi): 49650
   - Drainage Area (sq mi): 0.05703
   - Average Annual Rainfall (in): 10
   - Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
   (a) Relationship with TNW
   - ☐ Tributary flows directly to TNW
   - ☑ Tributary flows through 4 tributaries before entering TNW
   - Project waters are 30 (or more) river miles from TNW
### Project waters cross or serve as state boundaries.

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

### (b) General Tributary Characteristics

**Tributary is:** Natural

**Tributary properties with respect to top of bank (estimate):**
- **Average Width (ft):**
- **Average Depth (ft):**
- **Average Side Slopes:** 3:1

**Primary tributary substrate composition (check all that apply):**
- Silts
- Sands
- Concrete
- Muck
- Gravel
- Substrate - Vegetation
- Other, Explain: Stable.

**Tributary Condition/Stability** [e.g., highly eroding, sloughing banks. Explain:]

**Presence of Run/Riffle/Pool Complexes. Explain:** Not present.

**Tributary Geometry:** Relatively Straight

**Tributary Gradient (approximate average slope):** 1%

### (c) Flow

**Tributary Provides for:** Ephemeral Flow

**Estimate average number of flow events in review area/year:** 2-5

**Describe Flow Regime:** Ephemeral.

**Other Information on Duration and Volume:**

**Surface Flow is:** Discrete and Confined

**Subsurface Flow:**
- No
- Dye (or other) test performed: Explain: Discontinuous?

**Tributary Has** (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community
  - Other (list):

**Discontinuous? Explain:**
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

  - Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- [ ] TNWs
  - Linear Feet: 
  - Width (ft): 
  - TNW Acres
- [ ] Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs

- [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
- [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
  - Provide estimates for jurisdictional waters in the review area (check all that apply):
    - [ ] Tributary waters
    - Linear Feet: 
    - Width (Ft):
    - [ ] Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

- [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
  
  Provide estimates of jurisdictional waters within the review area (check all that apply):
  
  - Length (Linear Feet): 
  - Width (feet): 
  - Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
  - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
    
    Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
  
  Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.

---

does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: __________

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): __________ Acres: __________

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: __________ width (ft): __________
☐ Other Non-wetland Waters MBR acres: __________
☐ Wetlands MBR acres: __________

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 261.52 linear feet (ft), 5.97 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTON IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS
A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There  Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There  Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)  
      ☐ Wetlands adjacent to TNWs  
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
      ☐ Non-RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
      ☐ Impoundments of jurisdictional waters  
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands
   
   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters  Linear Feet  Width (ft) and/or  Acres  
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW: ___________________________ □ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

(i) General Area Conditions:

- Aquatic/Wildlife Diversity   Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of the TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs Linear Feet: Width (ft): TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: Width (ft).
       - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
       - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): ______  Acres: ______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section III.C.2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non-wetland-Waters (i.e., rivers, streams): linear feet: ______  width (ft): ______
☐ Other Non-wetland Waters MBR acres: ______
☐ Wetlands MBR acres: ______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 619.08 linear feet (ft), 8.18 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: [ ]
   - Vegetation: [ ]

   Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   - Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
   - Watershed Size (sq mi): 49650
   - Drainage Area (sq mi): 0.01781
   - Average Annual Rainfall (in): 10
   - Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW
   - [ ] Tributary flows directly to TNW
   - [X] Tributary flows through 4 tributaries before entering TNW
   - Project waters are 30 (or more) river miles from TNW
(b) General Tributary Characteristics

Tributary is: Natural  Explain:

Tributary properties with respect to top of bank (estimate):
- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- [ ] Silts
- [ ] Sands
- [ ] Concrete
- [ ] Muck
- [ ] Cobbles
- [ ] Gravel
- [ ] Substrate - Vegetation
- [ ] Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:

Subsurface Flow: No Explain:

Dye (or other) test performed:

Tributary Has (Check all that apply):

- [ ] Bed and Banks
- [ ] OHWM (check all the apply): OHWM Indicators:
  - [ ] Clear, natural line impressed on the bank
  - [ ] Changes in soil character
  - [ ] Shelving
  - [ ] Vegetation matted down, bent or absent
  - [ ] Leaf litter disturbed or washed away
  - [ ] Sediment deposition
  - [ ] Water staining
  - [ ] Presence of litter and debris
  - [ ] Destruction of terrestrial vegetation
  - [ ] Presence of wrack line
  - [ ] Sediment sorting
  - [ ] Scour
  - [ ] Multiple observed or predicted flow events
  - [ ] Abrupt change in plant community

- [ ] Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- [ ] High tide line indicated by:
- [ ] Mean High water Mark indicated by:
- [ ] oil or scum line along shore objects
- [ ] fine shell or debris deposits (foreshore)
- [ ] physical markings/characteristics
- [ ] tidal gauges
- [ ] other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: 

Identify Specific Pollutants, if known:

(iv) Biological Characteristics. Channel supports (check all that apply):

- [ ] Riparian Corridor Characteristics:
- [ ] Wetland Fringe Characteristics:

Habitat for:

- [ ] Federally Listed Species Explain findings:
- [ ] Fish/Spawn Areas Explain findings:
- [ ] Other environmentally-sensitive species Explain findings:
- [ ] Aquatic/Wildlife diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of dowgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

   - [ ] TNWs Linear Feet: [ ] Width (ft): [ ] TNW Acres [ ]
   - [ ] Wetlands adjacent to TNWs: [ ] Acres: [ ]

2. RPWs that flow directly or indirectly into TNWs

   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and rationale indicating that tributary is perennial:
   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - [ ] Tributary waters Linear Feet: [ ] Width (Ft).
       - [ ] Other non-wetland waters: [ ] Acres: [ ]

3. Non-RPWs that flow directly or indirectly into TNWs.

   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet): [ ] Width (feet): [ ] Acres: [ ]

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

   - [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
       - Provide acreage estimates for jurisdictional wetland in the review area: [ ] Acres: [ ]

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: [ ] Acres: [ ]

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
□ Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section III.C2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

□ Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
□ Other Non-wetland Waters MBR acres:
□ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters
☑ Other waters
☑ Wetlands

SECTION IV: DATA SOURCES

SECTION II: SUMMARY OF FINDINGS
A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: 
   - ☐ Vegetation
   - Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   - Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary, that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   - (i) General Area Conditions:
     - Watershed Size (sq mi): 49650
     - Drainage Area (sq mi): 1.02952
     - Average Annual Rainfall (in): 10
     - Average Annual Snowfall (in): 0
   - (ii) Physical Characteristics:
     - ☑ Tributary flows directly to TNW
     - ☐ Tributary flows through ☐ tributaries before entering TNW
     - Project waters are ☐ 30 (or more) river miles from TNW
APPROVED JURISDICTIONAL DETERMINATION FORM
U.S Army Corps of Engineers

Feature ID: 55

Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Gravel
- Cobble
- Bedrock
- Substrate - Vegetation

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.]
- Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry:
- Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5
Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:
Subsurface Flow: No Explain:

Dye (or other) test performed:

Tributary Has (Check all that apply):

- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining

Other (list):

- Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by:  
- Oil or scum line along shore objects  
- Fine shell or debris deposits (foreshore)  
- Physical markings/characteristics  
- Tidal gauges  
- Other

### (iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Identify Specific Pollutants, if known:

### (iv) Biological Characteristics. Channel supports (check all that apply):

3. **Characteristics of all wetlands adjacent to the tributary (if any)**

All wetland(s) being considered in cumulative analysis: ____________

Wetland acres in total being considered in cumulative analysis: ____________

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

**C. SIGNIFICANT NEXUS DETERMINATION**

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g., between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

**Note:** The above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs
   - Linear Feet: Width (ft): TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: Width (Ft):
       - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW
       - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
   - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): ______ Acres: ______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: ______ width (ft): ______
☐ Other Non-wetland Waters MBR acres: ______
☐ Wetlands MBR acres: ______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 744.92 linear feet (ft), 11.17 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☐ Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature

State: AZ  
County/Parish/borough: Pinal County  
City: N/A  

Center coordinates of site: Lat. 32.8482°N Long. -111.2599°W

Name of nearest waterbody:

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:

Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:

☒ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters Linear Feet Width (ft) and/or Acres

      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☒ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW: [ ] Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.19705
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   [ ] Tributary flows directly to TNW
   ☑ Tributary flows through 4 tributaries before entering TNW
   Project waters are 30 (or more) river miles from TNW
Project waters are [ ] river Miles from tributary to RPW:
Project waters are [ ] 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are [ ] aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

All wetland(s) being considered in cumulative analysis: 

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?

• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?

• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

APPROVED JURISDICTIONAL DETERMINATION FORM
U.S Army Cops of Engineers

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)    July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER      Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:  Drainage Feature 57

State:       AZ  County/Parish/borough:  Pinal City:  N/A

Center coordinates of site:  Lat.  32.8482°N  Long.  -111.2599°W

Name of nearest waterbody:  

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC):  15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:  

☒ Field Determination. Date(s):  10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters  Linear Feet  Width (ft) and/or  Acres
      Wetlands Acres:  

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

   ☒ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain:  Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: ____________________________________________
   - □ Vegetation
   - Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   - Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) **General Area Conditions:**
      - Watershed Size (sq mi): 49650
      - Drainage Area (sq mi): 0.26716
      - Average Annual Rainfall (in): 10
      - Average Annual Snowfall (in): 0
   (ii) **Physical Characteristics:**
      (a) **Relationship with TNW**
         - □ Tributary flows directly to TNW
         - ✔ Tributary flows through ______ tributaries before entering TNW
         - Project waters are ______ river miles from TNW
Project waters are river Miles from tributary to RPW:  
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:  
Project waters are aerial (straight) miles from tributary to RPW:  
Project waters cross or serve as state boundaries. Explain:  
Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

**b) General Tributary Characteristics**

<table>

<th>Tributary is:</th>
<th>Natural</th>
<th>Explain:</th>
</tr>
</thead>
</table>

**Tributary properties with respect to top of bank (estimate):**

| Average Width (ft): |  
| Average Depth (ft): |  
| Average Side Slopes: | 3:1  

**Primary tributary substrate composition (check all that apply):**

- [ ] Silts  
- [ ] Sands  
- [ ] Concrete  
- [ ] Muck  
- [ ] Gravel  
- [ ] Substrate - Vegetation  
- Other, Explain:  

**Tributary Condition/Stability** [e.g., highly eroding, sloughing banks. Explain: Stable.]

**Presence of Run/Riffle/Pool Complexes.** Explain: Not present.

**Tributary Geometry:** Relatively Straight  
**Tributary Gradient (approximate average slope):** 1%

**c) Flow:**

**Tributary Provides for:** Ephemeral Flow  
**Describe Flow Regime:** Ephemeral.  
**Estimate average number of flow events in review area/year:** 2-5  
**Other Information on Duration and Volume:**  
**Surface Flow is:** Discrete and Confined  
**Subsurface Flow:** No  
**Dye (or other) test performed:**  
**Tributary Has (Check all that apply):**

- [ ] Bed and Banks  
- [ ] OHWM (check all the apply): OHWM Indicators:
  - [ ] Clear, natural line impressed on the bank  
  - [ ] Changes in soil character  
  - [ ] Shelving  
  - [ ] Vegetation matted down, bent or absent  
  - [ ] Leaf litter disturbed or washed away  
  - [ ] Sediment deposition  
  - [ ] Water staining  
  - Presence of litter and debris  
  - Destruction of terrestrial vegetation  
  - Presence of wrack line  
  - Sediment sorting  
  - Scour  
  - Multiple observed or predicted flow events  
  - Abrupt change in plant community  
- Other (list):  
- [ ] Discontinuous? Explain:  

If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by:
- Mean High water Mark indicated by:
- oil or scum line along shore objects
- fine shell or debris deposits (foreshore)
- physical markings/characteristics
- tidal gauges
- other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain:

Identify Specific Pollutants, if known:

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics:
- Wetland Fringe Characteristics:

Habitat for:

- Federally Listed Species Explain findings:
- Fish/Spawn Areas Explain findings:
- Other environmentally sensitive species Explain findings:
- Aquatic/Wildlife diversity Explain:

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac):
- Wetland Type, Explain:
- Wetland Quality, Explain:

Project Wetlands Cross or Serve as State Boundaries, Explain:

(b) General Flow Relationship with Non-TNW:

- Wetland Flow is: Explain:
- Surface Flow is:

Characteristics:

- Subsurface Flow: Explain Findings:

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW

- Discrete wetland hydrologic connection Explain:
- Ecological connection Explain:
- Separated by berm/barrier Explain:

(d) Proximity (Relationship) to TNW

- Project Wetlands: River Miles from TNW:
- Project Wetlands: Aerial Miles from TNW:

Flow is From:

Estimate approximate Location of Wetland within Floodplain:
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics; ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- [ ] Riparian Buffer Characteristics (type, average width):
- [ ] Vegetation type/percent cover. Explain:

Habitat for:
- [ ] Federally Listed Species Explain:
- [ ] Fish/Spawn Areas Explain:
- [ ] Other environmentally-sensitive species Explain:
- [ ] Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

### D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. **TNWs and Adjacent Wetlands.** Check all that apply and provide size estimates in review area:

   - TNWs
   - Linear Feet: ______ Width (ft): ______TNW Acres ______
   - Wetlands adjacent to TNWs: Acres: ______

2. **RPWs that flow directly or indirectly into TNWs**

   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: ______
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: ______
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: ______ Width (ft): ______ Acres: ______
       - Other non-wetland waters: Acres: ______

3. **Non-RPWs that flow directly or indirectly into TNWs.**

   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet): ______ Width (feet): ______ Acres: ______

4. **Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.**

   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: ______
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: ______
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

5. **Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW**

   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
   - Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

6. **Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.**
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters linear feet (ft), width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW: 
☐ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.11942
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   ☐ Tributary flows directly to TNW
   ☑ Tributary flows through 4 tributaries before entering TNW

   Project waters are 30 (or more) river miles from TNW
### (b) General Tributary Characteristics

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNW, or to reduce the amount of pollutants or flood waters reaching a TNW?

• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?

• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- TNWs Linear Feet: Width (ft): TNW Acres
- Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
  - Provide estimates for jurisdictional waters in the review area (check all that apply):
    - Tributary waters Linear Feet: Width (Ft).
    - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
  - Provide estimates of jurisdictional waters within the review area (check all that apply):
    Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
    - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: 

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale: 
Length (linear feet): Acres: 

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters 

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft): 
- Other Non-wetland Waters MBR acres: 
- Wetlands MBR acres: 

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters linear feet (ft), width (ft) 
- Other waters acres 
- Wetlands acres 

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION
There  Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION
There  Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters  Linear Feet  Width (ft) and/or  Acres
      Wetlands Acres:  

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
     Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

   Identify TNW: ___________________________  ☐ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

   This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

   The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

   If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   | Watershed Size (sq mi):  | 49650 |
   | Drainage Area (sq mi):   | 0.18700 |
   | Average Annual Rainfall (in): | 10 |
   | Average Annual Snowfall (in): | 0 |

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   ☐ Tributary flows directly to TNW
   ☑ Tributary flows through 4 tributaries before entering TNW

   Project waters are 30 (or more) river miles from TNW
Feature ID: 59

U.S. Army Corps of Engineers

Project waters are

river Miles from tributary to RPW:

Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:

Project waters are

aerial (straight) miles from tributary to RPW:

Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):

Average Width (ft):
Average Depth (ft):
Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):

- Silts
- Sands
- Concrete
- Muck
- Gravel
- Substrate - Vegetation

Other, Explain:

Tributary Condition/ Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pooll Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:

Subsurface Flow: No Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

☐ TNWs Linear Feet: _______ Width (ft): _______ TNW Acres _______

☐ Wetlands adjacent to TNWs: Acres: _______

2. RPWs that flow directly or indirectly into TNWs

☐ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: _______

☐ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: _______

Provide estimates for jurisdictional waters in the review area (check all that apply):

☐ Tributary waters Linear Feet: _______ Width (ft): _______ Acres: _______

☐ Other non-wetland waters: Acres: _______

3. Non-RPWs that flow directly or indirectly into TNWs.

☐ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.

Provide estimates of jurisdictional waters within the review area (check all that apply):

Length (Linear Feet): _______ Width (feet): _______ Acres: _______

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

☐ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

☐ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: _______

☐ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: _______

Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

☐ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters 593.30 linear feet, 7.99 width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:  
Drainage Feature 6

State: AZ  
County/Parish/borough: Pinal County  
City: N/A

Center coordinates of site: Lat. 32.8482°N Long. -111.2599°W

Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: 

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request

☐ Check if other sites (e.g. offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:  
☐ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):

☐ TNWs (new)

☐ Wetlands adjacent to TNWs

☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs

☐ Non-RPWs that flow directly or indirectly into TNWs

☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs

☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs

☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs

☐ Impoundments of jurisdictional waters

☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

Non-Wetlands waters [ ] Linear Feet Width (ft) and/or [ ] Acres

Wetlands Acres: [ ]

c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☐ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW: ___________________________ □ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

(i) General Area Conditions:

<table>
<thead>
<tr>
<th>Characteristics</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Watershed Size (sq mi)</td>
<td>49650</td>
</tr>
<tr>
<td>Drainage Area (sq mi)</td>
<td>0.04821</td>
</tr>
<tr>
<td>Average Annual Rainfall (in)</td>
<td>10</td>
</tr>
<tr>
<td>Average Annual Snowfall (in)</td>
<td>0</td>
</tr>
</tbody>
</table>

(ii) Physical Characteristics:

(a) Relationship with TNW

- □ Tributary flows directly to TNW
- □ Tributary flows through _____ tributaries before entering TNW
- Project waters are _____ river miles from TNW

(b) Other characteristics

Other considerations include:

- [ ] Adjacent wetlands
- [ ] Adjacent waterbody

- Fish/Spawn Areas Explain:
- Other environmentally-sensitive species Explain:
- Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of polluants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatice resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW: ____________________________

☐ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 9.27540
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   ☑ Tributary flows through TNW

   Project waters are 30 (or more) river miles from TNW
APPROVED JURISDICTIONAL DETERMINATION FORM

3. Characteristics of all wetlands adjacent to the tributary (if any)
All wetland(s) being considered in cumulative analysis:
Wetland acres in total being considered in cumulative analysis:
Describe each wetland (directly abuts tributary?, size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION
A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.
Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.
Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs
   - Linear Feet:
   - Width (ft):
   - TNW Acres:
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters
       - Linear Feet:
       - Width (Ft):
       - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet):
     - Width (Feet):
     - Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
□ Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): _______ Acres: _______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

□ Non-wetland-Waters (i.e., rivers, streams): linear feet: _______ width (ft): _______
□ Other Non-wetland Waters MBR acres: _______
□ Wetlands MBR acres: _______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters 2015.72 linear feet (ft), 21.27 width (ft)
□ Other waters acres
□ Wetlands acres

SECTION IV: DATA SOURCES

**Additional Comments to Support JD:**
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:  Drainage Feature 61

State: AZ  
County/Parish/borough: Pinal County  
City: N/A

Center coordinates of site: Lat. 32.8482°N  
Long. -111.2599°W

Name of nearest waterbody:  
Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request  
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:  
☐ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There ☐ "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.  
☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There ☐ "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):
   ☐ TNWs (new)  
   ☐ Wetlands adjacent to TNWs  
   ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
   ☐ Non-RPWS that flow directly or indirectly into TNWs  
   ☐ Wetlands directly abutting RPWS that flow directly or indirectly into TNWs  
   ☐ Wetlands adjacent to but not directly abutting RPWS that flow directly or indirectly into TNWs  
   ☐ Wetlands adjacent to non-RPWS that flow directly or indirectly into TNWs  
   ☐ Impoundments of jurisdictional waters  
   ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

   Identify TNW: 
   □ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictio. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   | Watershed Size (sq mi):        | 49650 |
   | Drainage Area (sq mi):         | 26.06156 |
   | Average Annual Rainfall (in):  | 10    |
   | Average Annual Snowfall (in):  | 0     |

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   □ Tributary flows directly to TNW
   □ Tributary flows through 4 tributaries before entering TNW

   Project waters are 30 (or more) river miles from TNW
Feature ID: 61

U.S. Army Corps of Engineers

Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics
Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
Average Width (ft):
Average Depth (ft):
Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Cobbles
- Gravel
- Substrate - Vegetation
- Other, Explain:

Tributary Condition/ Stability [e.g., highly eroding, sloughing banks. Explain: Stable.
Presence of Run/Riffle/Pooll Complexes. Explain: Not present.
Tributary Geometry: Relatively Straight
Tributary Gradient (approximate average slope): 1%

(c) Flow:
Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5
Describe Flow Regime: Ephemeral.
Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:
Subsurface Flow: No Explain:

Dye (or other) test performed:

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community

Other (list):

Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: [ ]
- Mean High water Mark indicated by: [ ]
- Physical Characteristics:
  - Oil or scum line along shore objects
  - Fine shell or debris deposits (foreshore)
  - Physical markings/characteristics
  - Tidal gauges
  - Other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: [ ]

Identify Specific Pollutants, if known:

[ ]

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics:
- Wetland Fringe Characteristics:

Habitat for:

- Federally Listed Species Explain findings:
- Fish/Spawn Areas Explain findings:
- Other environmentally-sensitive species Explain findings:
- Aquatic/Wildlife diversity Explain:

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:
- Wetland Size (ac):
- Wetland Type, Explain:
- Wetland Quality, Explain:

Project Wetlands Cross or Serve as State Boundaries, Explain:

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: Explain:

Surface Flow is:

Characteristics:

Subsurface Flow: Explain Findings:

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW
  - Discrete wetland hydrologic connection Explain:
  - Ecological connection Explain:
  - Separated by berm/barrier Explain:

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW:

Project Wetlands: Aerial Miles from TNW:

Flow is From:

Estimate approximate Location of Wetland within Floodplain:
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if known:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer  Characteristics (type, average width):
- Vegetation  type/percent cover. Explain:
- Habitat for:
  - Federally Listed Species  Explain:
  - Fish/Spawn Areas  Explain:
  - Other environmentally-sensitive species  Explain:
  - Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within foot of a floodplain is not sole determinant of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- TNWs Linear Feet: Width (ft): TNW Acres
- Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

  Provide estimates for jurisdictional waters in the review area (check all that apply):

  - Tributary waters Linear Feet: Width (Ft).
  - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

  Provide estimates of jurisdictional waters within the review area (check all that apply):

  Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

  - Wetlands directly abutting an RPW where tributaries typically flow "seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW

  Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

  Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: 

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): ______  Acres: ______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters 

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: ______  width (ft): ______

☐ Other Non-wetland Waters MBR acres: ______

☐ Wetlands MBR acres: ______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters acres: 1964.05 linear feet (ft), 27.07 width (ft)

☐ Other waters acres

☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

   Wetlands Acres: 

   c. **Limits (boundaries) of Jurisdiction based on:**

   2. **Non-Regulated Waters/Wetlands (check if applicable):**

   ☑️ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   **Explain:** Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: [ ] Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.01351
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
      (a) Relationship with TNW
         [ ] Tributary flows directly to TNW
         [x] Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
Feature ID: 62

U.S Army Corps of Engineers

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

   c. Limits (boundaries) of Jurisdiction based on:

   2. Non-Regulated Waters/Wetlands (check if applicable):

   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ___________________________  □ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

   Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

   This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - [ ] TNWs Linear Feet: Width (ft): TNW Acres
   - [ ] Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs
   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review are (check all that apply):
       - [ ] Tributary waters Linear Feet: Width (Ft).
       - [ ] Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.

   Provide estimates of jurisdictional waters within the review area (check all that apply):
   - Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW

     Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

     Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet : width (ft): Acres:
☐ Other Non-wetland Waters MBR acres:
☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☒ Non-wetland waters linear feet (ft), width (ft)
☐ Other waters acres
☐ Wetlands acres

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:  
Drainage Feature 64

- State: AZ  
- County/Parish/borough: Pinal County  
- City: N/A

Center coordinates of site:  
Lat. 32.8482°N  
Long. -111.2599°W

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  
Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request

☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:

☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters  Linear Feet  Width (ft) and/or  Acres

      Wetlands Acres: 

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain:  
   Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW:  
   ☐ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.00076
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         ☐ Tributary flows directly to TNW
         ☑ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
Feature ID: 64

U.S Army Corps of Engineers

Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
  Average Width (ft):
  Average Depth (ft):
  Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
  ☑ Silts  ☑ Sands  ☑ Concrete  ☑ Muck
  ☑ Cobbles  ☑ Gravel  ☑ Substrate - Vegetation
  Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5
Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:
Subsurface Flow: No Explain:
☐ Dye (or other) test performed:

Tributary Has (Check all that apply):

☐ Bed and Banks
☐ OHWM (check all the apply): OHWM Indicators:
  ☑ Clear, natural line impressed on the bank
  ☑ Changes in soil character
  ☑ Shelving
  ☑ Vegetation matted down, bent or absent
  ☑ Leaf litter disturbed or washed away
  ☑ Sediment deposition
  ☑ Water staining
  Other (list):

☐ Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: 
- Mean High water Mark indicated by: 
- Oil or scum line along shore objects
- Fine shell or debris deposits (foreshore)
- Physical markings/characteristics
- Tidal gauges
- Other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: 
Identify Specific Pollutants, if known: 

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: 
- Wetland Fringe Characteristics: 

Habitat for:

- Federally Listed Species Explain findings: 
- Fish/Spawn Areas Explain findings: 
- Other environmentally -sensitive species Explain findings: 
- Aquatic/Wildlife diversity Explain:

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:
- Wetland Size (ac): 
- Wetland Type, Explain: 
- Wetland Quality, Explain: 

Project Wetlands Cross or Serve as State Boundaries, Explain: 

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: Explain: 
Surface Flow is:

Characteristics:

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW

- Discrete wetland hydrologic connection Explain: 
- Ecological connection Explain: 
- Separated by berm/barrier Explain: 

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: 
Project Wetlands: Aerial Miles from TNW: 
Flow is From: 

Estimate approximate Location of Wetland within Floodplain:
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics; etc.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer    Characteristics (type, average width):
- Vegetation    type/percent cover. Explain:
- Habitat for:
  - Federally Listed Species    Explain:
  - Fish/Spawn Areas    Explain:
  - Other environmentally-sensitive species    Explain:
  - Aquatic/Wildlife Diversity    Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

---

### D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. **TNWs and Adjacent Wetlands.** Check all that apply and provide size estimates in review area:

Additional Comments to Support JD:
SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:  
Drainage Feature 65

State: AZ  
County/Parish/borough: Pinal  
City: N/A

Center coordinates of site:  
Lat. 32.8482°N Long. -111.2599°W

Name of nearest waterbody: 
Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:
Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date: 
☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There ☐ Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There ☐ Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters ___________ Linear Feet ___________ Width (ft) and/or ___________ Acres
      Wetlands Acres: ___________

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS
A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: 
   - □ Vegetation
   - Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   - Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   - (i) General Area Conditions:
     - Watershed Size (sq mi): 49650
     - Drainage Area (sq mi): 0.00088
     - Average Annual Rainfall (in): 10
     - Average Annual Snowfall (in): 0
   - (ii) Physical Characteristics:
     - □ Tributary flows directly to TNW
     - □ Tributary flows through 4 tributaries before entering TNW
     - Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW: 
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: 
Project waters are aerial (straight) miles from tributary to RPW: 
Project waters cross or serve as state boundaries. Explain: 
Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics
Tributary is: Natural Explain: 
Tributary properties with respect to top of bank (estimate):
Average Width (ft): 
Average Depth (ft): 
Average Side Slopes: 3:1
Primary tributary substrate composition (check all that apply):
- Silts
- Cobble
- Bedrock
- Sands
- Concrete
- Gravel
- Substrate - Vegetation
- Muck
- Other, Explain: 
Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.
Presence of Run/Riffle/Pool Complexes. Explain: Not present.
Tributary Geometry: Relatively Straight
Tributary Gradient (approximate average slope): 1%

(c) Flow:
Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5
Describe Flow Regime: Ephemeral.
Other Information on Duration and Volume: 
Surface Flow is: Discrete and Confined Characteristics: 
Subsurface Flow: No Explain: 
Dye (or other) test performed: 

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community
Other (list): 
- Discontinuous? Explain: 

If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: ____________________________
- Mean High water Mark indicated by: ____________________________
- oil or scum line along shore objects
- fine shell or debris deposits (foreshore)
- physical markings/characteristics
- tidal gauges
- other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: ____________________________
Identify Specific Pollutants, if known: ____________________________

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: ____________________________
- Wetland Fringe Characteristics: ____________________________

Habitat for:

- Federally Listed Species Explain findings: ____________________________
- Fish/Spawn Areas Explain findings: ____________________________
- Other environmentally-sensitive species Explain findings: ____________________________
- Aquatic/Wildlife diversity Explain: ____________________________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:
- Wetland Size (ac): ____________________________
- Wetland Type, Explain: ____________________________
- Wetland Quality, Explain: ____________________________

Project Wetlands Cross or Serve as State Boundaries, Explain: ____________________________

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: ____________________________ Explain: ____________________________
Surface Flow is: ____________________________
Characteristics: ____________________________
Subsurface Flow: ____________________________ Explain Findings: ____________________________

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW
  - Discrete wetland hydrologic connection Explain: ____________________________
  - Ecological connection Explain: ____________________________
  - Separated by berm/barrier Explain: ____________________________

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: ____________________________
Project Wetlands: Aerial Miles from TNW: ____________________________
Flow is From: ____________________________
Estimate approximate Location of Wetland within Floodplain: ____________________________
(ii) Chemical Characteristics:
Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain
Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer Characteristics (type, average width):

- Vegetation type/percent cover. Explain:

Habitat for:

- Federally Listed Species Explain:

- Fish/Spawn Areas Explain:

- Other environmentally-sensitive species Explain:

- Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
Approved Jurisdictional Determination Form
U.S Army Corps of Engineers

Does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

### D. Determinations of Jurisdictional Findings. The Subject Waters/Wetlands Are (Check All That Apply)

#### 1. TNWs and Adjacent Wetlands

<table>

#### 2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and rationale indicating that tributary is perennial:
- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
  - Provide estimates for jurisdictional waters in the review area (check all that apply):
    - Tributary waters: Linear Feet: Width (Ft).
    - Other non-wetland waters: Acres:

#### 3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates of jurisdictional waters within the review area (check all that apply):
- Length (Linear Feet): Width (feet): Acres:

#### 4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:

  - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

#### 5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

  - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

#### 6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres): □

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: □

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale: □
Length (linear feet): □ Acres: □

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters □

Explain finding of no Significant Nexus: □ See Section III C.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: □ width (ft): □
☐ Other Non-wetland Waters MBR acres: □
☐ Wetlands MBR acres: □

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters linear feet (ft), □ 55.20 width (ft) □ 3.06 Acres: □
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW: ____________

☐ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.04663
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   ☐ Tributary flows directly to TNW
   ☑ Tributary flows through 4 tributaries before entering TNW

   Project waters are 30 (or more) river miles from TNW
Feature ID: 66

Project waters are river Miles from tributary to RPW: 
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: 
Project waters are aerial (straight) miles from tributary to RPW: 
Project waters cross or serve as state boundaries. 

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes:

Primary tributary substrate composition (check all that apply):
- [ ] Silts

3. Characteristics of all wetlands adjacent to the tributary (if any)
All wetland(s) being considered in cumulative analysis:
Wetland acres in total being considered in cumulative analysis:
Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION
A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.
Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:
This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. **TNWs and Adjacent Wetlands.** Check all that apply and provide size estimates in review area:

   - TNWs Linear Feet: [ ] Width (ft): [ ] TNW Acres [ ]
   - Wetlands adjacent to TNWs: [ ] Acres: [ ]

2. **RPWs that flow directly or indirectly into TNWs**

   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: [ ]
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: [ ]

     Provide estimates for jurisdictional waters in the review area (check all that apply):

     - Tributary waters Linear Feet: [ ] Width (Ft): [ ] Acres: [ ]
     - Other non-wetland waters: [ ] Acres: [ ]

3. **Non-RPWs that flow directly or indirectly into TNWs.**

   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.

   Provide estimates of jurisdictional waters within the review area (check all that apply):

   - Length (Linear Feet): [ ] Width (feet): [ ] Acres: [ ]

4. **Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.**

   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: [ ]
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: [ ]

     Provide acreage estimates for jurisdictional wetland in the review area: [ ] Acres: [ ]

5. **Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW**

   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdicalional. Data supporting this conclusion is provided at Section III.C.

   Provide acreage estimates for jurisdictional wetland in the review area: [ ] Acres: [ ]

6. **Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.**
☐ Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section III.C.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
☐ Other Non-wetland Waters MBR acres:
☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters linear feet (ft), width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTON I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD) July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 67

State: AZ County/Parish/borough: Pinal County City: N/A

Center coordinates of site: Lat. 32.8482°N Long. -111.2599°W

Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:

☒ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

   ☐ TNWs (new)

   ☐ Wetlands adjacent to TNWs

   ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs

   ☐ Non-RPWs that flow directly or indirectly into TNWs

   ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs

   ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs

   ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs

   ☐ Impoundments of jurisdictional waters

   ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

   Non-Wetlands waters Linear Feet Width (ft) and/or Acres

   Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☒ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW:
   
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.10408
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   □ Tributary flows directly to TNW
   ✔ Tributary flows through 4 tributaries before entering TNW

   Project waters are 30 (or more) river miles from TNW
Feature ID: APPROVED JURISDICTIONAL DETERMINATION FORM
U.S. Army Corps of Engineers

Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):

- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Gravel
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5
Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:
Subsurface Flow: No Explain:

Dye (or other) test performed:

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community

Other (list):

Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: ___________
- Mean High water Mark indicated by: ___________
- oil or scum line along shore objects
- fine shell or debris deposits (foreshore)
- physical markings/characteristics
- tidal gauges
- other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: ___________

Identify Specific Pollutants, if known: ___________

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: ___________
- Wetland Fringe Characteristics: ___________

Habitat for:

- Federally Listed Species Explain findings: ___________
- Fish/Spawn Areas Explain findings: ___________
- Other environmentally-sensitive species Explain findings: ___________
- Aquatic/Wildlife diversity Explain: ___________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac): ___________
- Wetland Type, Explain: ___________
- Wetland Quality, Explain: ___________

Project Wetlands Cross or Serve as State Boundaries, Explain: ___________

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: ___________ Explain: ___________

Surface Flow is: ___________

Characteristics: ___________

Subsurface Flow: ___________ Explain Findings: ___________

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW

Discrete wetland hydrologic connection Explain: ___________

Ecological connection Explain: ___________

Separated by berm/barrier Explain: ___________

(d) Proximity (Relationship) to TNW:

Project Wetlands: River Miles from TNW: ___________

Project Wetlands: Aerial Miles from TNW: ___________

Flow is From: ___________

Estimate approximate Location of Wetland within Floodplain: ___________
(ii) Chemical Characteristics:
Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: etc.).
Explain
Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):
- Riparian Buffer Characteristics (type, average width):
- Vegetation type/percent cover. Explain:
  Habitat for:
  - Federally Listed Species Explain:
  - Fish/Spawn Areas Explain:
  - Other environmentally-sensitive species Explain:
  - Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)
All wetland(s) being considered in cumulative analysis:
Wetland acres in total being considered in cumulative analysis:
Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION
A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.
Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:
This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

<table>
<thead>
<tr>
<th></th>
<th>TNWs</th>

<td></td>
</tr>
</tbody>
</table>

2. RPWs that flow directly or indirectly into TNWs

|   | Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: |
|   | Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: |
|   | Provide estimates for jurisdictional waters in the review area (check all that apply): |
|   | Tributary waters | Linear Feet: | Width (Ft): |
|   | Other non-wetland waters: | Acres: |

3. Non-RPWs that flow directly or indirectly into TNWs.

|   | Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c. | Provide estimates of jurisdictional waters within the review area (check all that apply): |
|   | Length (Linear Feet): | Width (feet): | Acres: |

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

|   | Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands. |
|   | Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: |
|   | Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW |
|   | Provide acreage estimates for jurisdictional wetland in the review area: Acres: |

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

|   | Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C. | Provide acreage estimates for jurisdictional wetland in the review area: Acres: |

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Provide estimates for jurisdictional wetland in the review area (in acres):

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- [ ] Non-wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- [ ] Other Non-wetland Waters MBR acres:
- [ ] Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- [ ] Non-wetland waters 711.27 linear feet, 4.97 width (ft)
- [ ] Other waters acres
- [ ] Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters Linear Feet Width (ft) and/or Acres

      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ___________________________ □ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e., tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a TNW that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.00462
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
      (a) Relationship with TNW
         □ Tributary flows directly to TNW
         ✔ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW: 
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: 
Project waters are aerial (straight) miles from tributary to RPW: 
Project waters cross or serve as state boundaries. Explain: 

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain: 

Tributary properties with respect to top of bank (estimate):
Average Width (ft): 
Average Depth (ft): 
Average Side Slopes: 3:1 

Primary tributary substrate composition (check all that apply):
- ☑ Silts
- ☑ Bedrock
- ☑ Gravel
- ☑ Substrate - Vegetation
- ☑ Sands
- ☑ Concrete
- ☑ Muck
- ☑ Other, Explain: 

Tributary Condition/ Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/P ool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:
Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5
Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume: 

Surface Flow is: Discrete and Confined Characteristics: 
Subsurface Flow: No Explain: 

☐ Dye (or other) test performed: 

Tributary Has (Check all that apply):

- Other environmentally-sensitive species Explain:
- Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- [ ] TNWs Linear Feet: Width (ft): TNW Acres
- [ ] Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs

- [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

- [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
  - Provide estimates for jurisdictional waters in the review are (check all that apply):
    - [ ] Tributary waters Linear Feet: Width (ft).
    - [ ] Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

- [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

  Provide estimates of jurisdictional waters within the review area (check all that apply):
  - Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

- [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

  Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Feature ID: APPROVED JURISDICTIONAL DETERMINATION FORM U.S Army Corps of Engineers

☐ Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres: 

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):

☐ Other Non-wetland Waters MBR acres:

☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters linear feet (ft), width (ft)

☐ Other waters acres

☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

APPROVED JURISDICTIONAL DETERMINATION FORM
U.S Army Corps of Engineers

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION
A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD) July 5, 2013
B. DISTRICT OFFICE, FILE NAME, AND NUMBER Los Angeles District, File No. Pending
C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 69
   State: AZ  County/Parish/borough: Pinal County  City: N/A
   Center coordinates of site: Lat. 32.8482°N  Long. -111.2599°W
   Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam
   Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: Gila River between Powers Butte and Gillespie Dam
   Name of watershed or Hydrologic Unit Code (HUC): 15050100
   Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
   Check if other sites (e.g., offsite mitigation sites, disposal sites, etc…) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)
   ○ Office (Desk) Determination. Date: 
   ✔ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS
A. RHA SECTION 10 DETERMINATION OF JURISDICATION
   There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.
   ○ Waters subject to the ebb and flow of the tide.
   ○ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION
   There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.
   1. Waters of the U.S.
      a. Indicate presence of water of U.S. in review area (Check all the apply):
         ○ TNWs (new)
         ○ Wetlands adjacent to TNWs
         ○ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
         ○ Non-RPWs that flow directly or indirectly into TNWs
         ○ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
         ○ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
         ○ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
         ○ Impoundments of jurisdictional waters
         ○ Isolated (interstate or intrastate) waters, including isolated wetlands
      b. Identify (estimate) size of waters of the U.S. in the review area
         Non-Wetlands waters Linear Feet Width (ft) and/or Acres
         Wetlands Acres:
      c. Limits (boundaries) of Jurisdiction based on:
   2. Non-Regulated Waters/Wetlands (check if applicable):
      ✔ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
         Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

   Identify TNW: ____________________________ □ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 2.32580
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

      □ Tributary flows directly to TNW
      ✔ Tributary flows through 4 tributaries before entering TNW

      Project waters are 30 (or more) river miles from TNW
(b) General Tributary Characteristics

Tributary is: Natural  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs
     - Linear Feet: ___ Width (ft): ___ TNW Acres: ___
   - Wetlands adjacent to TNWs: Acres: ___

2. RPWs that flow directly or indirectly into TNWs:
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: ___
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: ___
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters: Linear Feet: ___ Width (ft): ___
       - Other non-wetland waters: Acres: ___

3. Non-RPWs that flow directly or indirectly into TNWs:
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet): ___ Width (feet): ___ Acres: ___

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs:
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: ___
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: ___
       - Provide acreage estimates for jurisdictional wetland in the review area: Acres: ___

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: ___

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
6. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:  
Length (linear feet):  
Acres:  

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section III.C.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet:  
-width (ft):  
- Other Non-wetland Waters MBR acres:  
- Wetlands MBR acres:  

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters 1177.02 linear feet, 8.25 width (ft) 
- Other waters acres 
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

- Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.
- Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant
- Office Concurs with data sheets/delineation report
- Office Does Not Concur with data sheets/delineation report
- Data Sheets Prepared by the Corps
- Corps Navigable Water Study

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:  Drainage Feature 7

State:  AZ  County/Parish/borough:  Pinal County  City:  N/A

Center coordinates of site:  Lat. 32.8482°N  Long. -111.2599°W

Name of nearest waterbody:  

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC):  15050100

☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)
☐ Office (Desk) Determination.  Date:  
☑ Field Determination.  Date(s):  10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There ☐ Are ☑ "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There ☐ Are ☑ "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters ___________ Linear Feet  Width (ft) and/or ___________ Acres
      Wetlands Acres: ___________

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

      Explain:  Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1 only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1; otherwise, see Section III.B below.

1. TNW

   Identify TNW: ____________________________ □ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland, that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.07220
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   □ Tributary flows directly to TNW
   ✓ Tributary flows through _____ tributaries before entering TNW
   □ Project waters are ______ (or more) river miles from TNW
**APPROVED JURISDICTIONAL DETERMINATION FORM**

U.S Army Corps of Engineers

Project waters are __________ river Miles from tributary to RPW:

Project waters are __________ aerial (straight) miles from tributary to TNW:

Project waters are __________ aerial (straight) miles from tributary to RPW:

Project waters cross or serve as state boundaries. **Explain:**

**Identify flow route to TNW**

Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

### (b) General Tributary Characteristics

**Tributary is:** Natural  **Explain:**

**Tributary properties with respect to top of bank (estimate):**

- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

**Primary tributary substrate composition (check all that apply):**

- [ ] Silts
- [ ] Sands
- [ ] Concrete
- [ ] Muck
- [ ] Cobble
- [ ] Gravel
- [ ] Substrate - Vegetation
- Other, **Explain:**

**Tributary Condition/Stability** [e.g., highly eroding, sloughing banks. **Explain:** Stable.

**Presence of Run/Riffle/Pool Complexes. **Explain:** Not present.

**Tributary Geometry:** Relatively Straight

**Tributary Gradient (approximate average slope):** 1%

### (c) Flow:

**Tributary Provides for:** Ephemeral Flow

**Estimate average number of flow events in review area/year:** 2-5

**Describe Flow Regime:** Ephemeral.

**Other Information on Duration and Volume:**

**Surface Flow is:** Discrete and Confined  **Characteristics:**

**Subsurface Flow:** No  **Explain:**

- [ ] Dye (or other) test performed:

**Tributary Has (Check all that apply):**

- [ ] Bed and Banks
- [ ] OHWM (check all the apply): OHWM Indicators:
  - [ ] Clear, natural line impressed on the bank
  - [ ] Changes in soil character
  - [ ] Shelving
  - [ ] Vegetation matted down, bent or absent
  - [ ] Leaf litter disturbed or washed away
  - [ ] Sediment deposition
  - [ ] Water staining
  - Other (list):

- [ ] Discontinuous?  **Explain:**
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: [ ]
- Oil or scum line along shore objects [ ]
- Fine shell or debris deposits (foreshore) [ ]
- Physical markings/characteristics [ ]
- Tidal gauges [ ]
- Other [ ]

- Mean high water mark indicated by:
- Survey to available datum [ ]
- Physical markings [ ]
- Vegetation lines/changes in vegetation types [ ]

(iii) Chemical Characteristics:

Characterize tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain:

Identify specific pollutants, if known:

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian corridor characteristics:
- Wetland fringe characteristics:

Habitat for:

- Federally listed species: Explain findings:
- Fish/spawn areas: Explain findings:
- Other environmentally sensitive species: Explain findings:
- Aquatic/wildlife diversity: Explain:

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General wetland characteristics

Properties:
- Wetland size (ac):
- Wetland type, explain:
- Wetland quality, explain:

Project wetlands cross or serve as state boundaries, explain:

(b) General flow relationship with non-TNW:

Wetland flow is: explain:

Surface flow is:

- Characteristics:

Subsurface flow: explain findings:

(c) Wetland adjacency determination with non-TNW:

- Wetland directly abutting non-TNW
- Wetland not directly abutting non-TNW
  - Discrete wetland hydrologic connection explain:
  - Ecological connection explain:
  - Separated by berm/barrier explain:

(d) Proximity (relationship) to TNW

Project wetlands: river miles from TNW:

Project wetlands: aerial miles from TNW:

Flow is from:

Estimate approximate location of wetland within floodplain:
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

☐ Riparian Buffer  Characteristics (type, average width):

☐ Vegetation  type/percent cover. Explain:

Habitat for:

☐ Federally Listed Species  Explain:

☐ Fish/Spawn Areas  Explain:

☐ Other environmentally-sensitive species  Explain:

☐ Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs Linear Feet: ___________________ Width (ft): _______ TNW Acres _______
   - Wetlands adjacent to TNWs: Acres: _______

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: _______
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: _______
     Provide estimates for jurisdictional waters in the review area (check all that apply):
     - Tributary waters Linear Feet: _______ Width (ft): _______ Acres: _______
     - Other non-wetland waters: Acres: _______

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.
     Provide estimates of jurisdictional waters within the review area (check all that apply):
     Length (Linear Feet): _______ Width (feet): _______ Acres: _______

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: _______
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: _______

     Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: 

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres: 

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft): 
- Other Non-wetland Waters MBR acres: 
- Wetlands MBR acres: 

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters linear feet (ft), width (ft) 
- Other waters acres 
- Wetlands acres 

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

- Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.
- Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant
  - Office Concurs with data sheets/delineation report
  - Office Does Not Concur with data sheets/delineation report

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:  Drainage Feature  70

State:  AZ  County/Parish/borough:  Pinal County  City:  N/A

Center coordinates of site:  Lat.  32.8482°N  Long.  -111.2599°W

Name of nearest waterbody:  Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  

Name of watershed or Hydrologic Unit Code (HUC):  15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination.  Date:  

☒ Field Determination.  Date(s):  10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There ☐ No ☒ "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There ☐ No ☒ "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):

☐ TNWs (new)
☐ Wetlands adjacent to TNWs
☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
☐ Non-RPWs that flow directly or indirectly into TNWs
☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
☐ Impoundments of jurisdictional waters
☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

Non-Wetlands waters  Linear Feet  Width (ft) and/or  Acres

Wetlands Acres:

C. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☒ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain:  Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW:  
   - ☐ Vegetation

   Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary, that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
   - Watershed Size (sq mi): 49650
   - Drainage Area (sq mi): 10.99181
   - Average Annual Rainfall (in): 10
   - Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
   - ☐ Tributary flows directly to TNW
   - ☑ Tributary flows through 4 tributaries before entering TNW
   - Project waters are 30 (or more) river miles from TNW
(b) General Tributary Characteristics

Tributary is: Natural
Explain:

Tributary properties with respect to top of bank (estimate):
- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- [ ] Silts
- [ ] Sands
- [ ] Concrete
- [ ] Muck
- [ ] Cobble
- [ ] Gravel
- [ ] Substrate - Vegetation
Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain:]
Stable.

Presence of Run/Riffle/Pool Complexes. Explain:
Not present.

Tributary Geometry:
- Relatively Straight

Tributary Gradient (approximate average slope):
1%

(c) Flow:

Tributary Provides for:
- Ephemeral Flow

Estimate average number of flow events in review area/year:
2-5

Describe Flow Regime:
Ephemeral.

Other Information on Duration and Volume:

Surface Flow is:
- Discrete and Confined
Characteristics:

Subsurface Flow:
- No
Explain:

Dye (or other) test performed:

Tributary Has (Check all that apply):

- [ ] Bed and Banks
- [ ] OHWM (check all the apply): OHWM Indicators:
  - [ ] Clear, natural line impressed on the bank
  - [ ] Changes in soil character
  - [ ] Shelving
  - [ ] Vegetation matted down, bent or absent
  - [ ] Leaf litter disturbed or washed away
  - [ ] Sediment deposition
  - [ ] Water staining
Other (list):

- [ ] Discontinuous?
Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: [ ]
- Mean High water Mark indicated by: [ ]
- oil or scum line along shore objects [ ]
- fine shell or debris deposits (foreshore) [ ]
- physical markings/characteristics [ ]
- tidal gauges [ ]
- other [ ]

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: [ ]

Identify Specific Pollutants, if known: [ ]

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: [ ]
- Wetland Fringe Characteristics: [ ]

Habitat for:

- Federally Listed Species Explain findings: [ ]
- Fish/Spawn Areas Explain findings: [ ]
- Other environmentally -sensitive species Explain findings: [ ]
- Aquatic/Wildlife diversity Explain: [ ]

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

Wetland Size (ac): [ ]
Wetland Type, Explain: [ ]
Wetland Quality, Explain: [ ]
Project Wetlands Cross or Serve as State Boundaries, Explain: [ ]

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: Explain: [ ]
Surface Flow is: [ ]
Characteristics: [ ]
Subsurface Flow: Explain Findings: [ ]

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW [ ]
- Wetland Not Directly Abutting Non-TNW [ ]
- Discrete wetland hydrologic connection Explain: [ ]
- Ecological connection Explain: [ ]
- Separated by berm/barrier Explain: [ ]

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: [ ]
Project Wetlands: Aerial Miles from TNW: [ ]
Flow is From: [ ]
Estimate approximate Location of Wetland within Floodplain: [ ]
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- ☐ Riparian Buffer Characteristics (type, average width):
- ☐ Vegetation type/percent cover. Explain: Habitat for:
  - ☐ Federally Listed Species Explain:
  - ☐ Fish/Spawn Areas Explain:
  - ☐ Other environmentally-sensitive species Explain:
  - ☐ Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- [ ] TNWs Linear Feet: [ ] Width (ft): [ ] TNW Acres [ ]
- [ ] Wetlands adjacent to TNWs: Acres: [ ]

2. RPWs that flow directly or indirectly into TNWs

- [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: [ ]
- [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: [ ]

Provide estimates for jurisdictional waters in the review area (check all that apply):

- [ ] Tributary waters Linear Feet: [ ] Width (Ft): [ ]
- [ ] Other non-wetland waters: Acres: [ ]

3. Non-RPWs that flow directly or indirectly into TNWs.

- [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

Provide estimates of jurisdictional waters within the review area (check all that apply):

Length (Linear Feet): [ ] Width (feet): [ ] Acres: [ ]

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: [ ]
  - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: [ ]

Provide acreage estimates for jurisdictional wetland in the review area: Acres: [ ]

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetland in the review area: Acres: [ ]

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: 

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale: 
Length (linear feet): _______ Acres: _______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters 
Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: _______ width (ft): _______
☐ Other Non-wetland Waters MBR acres: _______
☐ Wetlands MBR acres: _______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 612.39 linear feet (ft), 6.54 width (ft) 
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 71

State: AZ  
County/Parish/borough: Pinal  
City: N/A

Center coordinates of site: Lat. 32.8482°N  
Long. -111.2599"W

Name of nearest waterbody:  
Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:

☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329 in the review area.

☑ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):

☐ TNWs (new)
☐ Wetlands adjacent to TNWs
☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
☐ Non-RPWs that flow directly or indirectly into TNWs
☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
☐ Impoundments of jurisdictional waters
☐ Isolated ( interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

Non-Wetlands waters Linear Feet Width (ft) and/or Acres

Wetlands Acres:

C. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ___________________________  □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.01090
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      ☑️ Tributary flows directly to TNW
      □ Tributary flows through ___ tributaries before entering TNW
      Project waters are ___ (or more) river miles from TNW
**Feature ID:** 71

**U.S. Army Corps of Engineers**

Project waters are **river** Miles from tributary to RPW:

Project waters are **30 (or more)** aerial (straight) miles from tributary to TPW:

Project waters are **aerial (straight)** miles from tributary to RPW:

Project waters cross or serve as state boundaries. **Explain:**

Identify flow route to TNW: **Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.**

### (b) General Tributary Characteristics

<table>
<thead>
<tr>
<th>Tributary is:</th>
<th>Natural</th>
<th><strong>Explain:</strong></th>
</tr>
</thead>
</table>

**Tributary properties with respect to top of bank (estimate):**

- **Average Width (ft):**
- **Average Depth (ft):**
- **Average Side Slopes:** 3:1

**Primary tributary substrate composition (check all that apply):**

- [ ] Silts
- [ ] Sands
- [ ] Concrete
- [ ] Muck
- [ ] Gravel
- [ ] Substrate - Vegetation
- [ ] Other, **Explain:**

**Tributary Condition/Stability** [e.g., highly eroding, sloughing banks. **Explain:** Stable.]

**Presence of Run/Riffle/Pool Complexes. **Explain:** Not present.

**Tributary Geometry:** Relatively Straight

**Tributary Gradient (approximate average slope):** 1%

### (c) Flow

**Tributary Provides for:** Ephemeral Flow

**Describe Flow Regime:** Ephemeral.

**Other Information on Duration and Volume:**

**Surface Flow is:** Discrete and Confined

**Subsurface Flow:** No

- [ ] Dye (or other) test performed:

**Tributary Has (Check all that apply):**

- [ ] Bed and Banks
- [ ] **OHWM (check all the apply):** OHWM Indicators:
  - [ ] Clear, natural line impressed on the bank
  - [ ] Changes in soil character
  - [ ] Shelving
  - [ ] Vegetation matted down, bent or absent
  - [ ] Leaf litter disturbed or washed away
  - [ ] Sediment deposition
  - [ ] Water staining
  - [ ] Presence of litter and debris
  - [ ] Destruction of terrestrial vegetation
  - [ ] Presence of wrack line
  - [ ] Sediment sorting
  - [ ] Scour
  - [ ] Multiple observed or predicted flow events
  - [ ] Abrupt change in plant community

- [ ] Discontinuous? **Explain:**
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: __________________________
- Mean High water Mark indicated by: ______________________
- oil or scum line along shore objects
- fine shell or debris deposits (foreshore)
- physical markings/characteristics
- tidal gauges
- other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: __________________________________________

Identify Specific Pollutants, if known: ____________________________

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: ____________________________
- Wetland Fringe Characteristics: ______________________________

Habitat for:

- Federally Listed Species Explain findings: _______________________
- Fish/Spawn Areas Explain findings: ____________________________
- Other environmentally -sensitive species Explain findings: __________
- Aquatic/Wildlife diversity Explain: ______________________________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac): __________________________
- Wetland Type, Explain: ________________________
- Wetland Quality, Explain: ______________________

Project Wetlands Cross or Serve as State Boundaries, Explain: ________________

(b) General Flow Relationship with Non-TNW:

- Wetland Flow is: ________________________________
  Explain: ______________________________________
- Surface Flow is: _________________________________

  Characteristics: _______________________________

Subsurface Flow: ________________________________
  Explain Findings: ______________________________

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW
  - Discrete wetland hydrologic connection Explain: ________________________
  - Ecological connection Explain: ________________________________
  - Separated by berm/barrier Explain: ________________________________

(d) Proximity (Relationship) to TNW

- Project Wetlands: River Miles from TNW: ________________
- Project Wetlands: Aerial Miles from TNW: ________________
- Flow is From: ________________________________
- Estimate approximate Location of Wetland within Floodplain: _______________
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics; ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

☐ Riparian Buffer  Characteristics (type, average width):

☐ Vegetation  type/percent cover. Explain:

Habitat for:

☐ Federally Listed Species  Explain:

☐ Fish/Spawn Areas  Explain:

☐ Other environmentally-sensitive species  Explain:

☐ Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g., between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands.  Check all that apply and provide size estimates in review area:
   - TNWs
   - Width (ft):
   - TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters:
       - Linear Feet:
       - Width (Ft):
       - Other non-wetland waters:
         - Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet):
     - Width (feet):
     - Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
       - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
   - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams):  linear feet:
☐ Other Non-wetland Waters MBR
☐ Wetlands MBR

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters
☐ Other waters
☐ Wetlands

SECTION IV: DATA SOURCES

☐ Office (Desk) Determination. Date: 

☒ Field Determination. Date(s):  10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters  Linear Feet  Width (ft) and/or  Acres
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☒ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW: ___________________________ ☐ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

(i) General Area Conditions:

<table>
<thead>
<tr>
<th>Characteristics</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Watershed Size (sq mi)</td>
<td>49650</td>
</tr>
<tr>
<td>Drainage Area (sq mi)</td>
<td>0.06149</td>

<tr>
<td>Average Annual Rainfall (in)</td>
<td>10</td>
</tr>
<tr>
<td>Average Annual Snowfall (in)</td>
<td>0</td>
</tr>
</tbody>
</table>

(ii) Physical Characteristics:

(a) Relationship with TNW

☐ Tributary flows directly to TNW

✓ Tributary flows through _______ tributaries before entering TNW

Project waters are _______ (or more) river miles from TNW
Project waters are 30 (or more) aerial (straight) miles from tributary to RPW: Explain:

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- [ ] Silts
- [ ] Sands
- [ ] Concrete
- [ ] Muck
- [ ] Gravel
- [ ] Substrate - Vegetation
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:

Subsurface Flow: No Explain:

Dye (or other) test performed:

Tributary Has (Check all that apply):
- [ ] Bed and Banks
- [ ] OHWM (check all the apply): OHWM Indicators:
  - [ ] Clear, natural line impressed on the bank
  - [ ] Changes in soil character
  - [ ] Shelving
  - [ ] Vegetation matted down, bent or absent
  - [ ] Leaf litter disturbed or washed away
  - [ ] Sediment deposition
  - [ ] Water staining
  - [ ] Presence of litter and debris
  - [ ] Destruction of terrestrial vegetation
  - [ ] Presence of wrack line
  - [ ] Sediment sorting
  - [ ] Scour
  - [ ] Multiple observed or predicted flow events
  - [ ] Abrupt change in plant community
- [ ] Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: ____________________________
- Mean High water Mark indicated by: _______________________
- Oil or scum line along shore objects
- Fine shell or debris deposits (foreshore)
- Physical markings/characteristics
- Tidal gauges

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- [ ] TNWs Linear Feet: __________ Width (ft): _______ TNW Acres _______
- [ ] Wetlands adjacent to TNWs: Acres: __________

2. RPWs that flow directly or indirectly into TNWs

- [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: __________
- [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: __________

Provide estimates for jurisdictional waters in the review area (check all that apply):

- [ ] Tributary waters Linear Feet: __________ Width (Ft): __________ Acres: __________
- [ ] Other non-wetland waters: Acres: __________

3. Non-RPWs that flow directly or indirectly into TNWs.

- [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

Provide estimates of jurisdictional waters within the review area (check all that apply):

Length (Linear Feet): __________ Width (feet): __________ Acres: __________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: __________
  - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: __________

Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet):  [ ] Width (ft):  [ ] Acres:  [ ]

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet :  [ ] width (ft):  [ ]
☐ Other Non-wetland Waters MBR acres:  [ ]
☐ Wetlands MBR acres:  [ ]

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters  [ ] linear feet (ft), 525.29  width (ft) 5.97
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION  
There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.
☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION  
There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters ___________ Linear Feet ___________ Width (ft) and/or ___________ Acres
      Wetlands Acres: ___________

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   - Identify TNW: 
   - Vegetation: 

Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   - 

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   - General Area Conditions:
     - Watershed Size (sq mi): 49650
     - Drainage Area (sq mi): 0.23371
     - Average Annual Rainfall (in): 10
     - Average Annual Snowfall (in): 0
   - Physical Characteristics:
     - Relationship with TNW:
       - Tributary flows directly to TNW
       - Tributary flows through 4 tributaries before entering TNW

   Project waters are 30 (or more) river miles from TNW
### (b) General Tributary Characteristics

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?, size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?

• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?

• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

   - [ ] TNWs Linear Feet: _______ Width (ft): _______ TNW Acres _______
   - [ ] Wetlands adjacent to TNWs: Acres: _______

2. RPWs that flow directly or indirectly into TNWs

   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: _______
   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: _______
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - [ ] Tributary waters Linear Feet: _______ Width (ft): _______ Acres: _______
       - [ ] Other non-wetland waters: Acres: _______

3. Non-RPWs that flow directly or indirectly into TNWs.

   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet): _______ Width (feet): _______ Acres: _______

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

   - [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: _______
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: _______
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
☐ Other Non-wetland Waters MBR acres:
☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 551.72 linear feet (ft), 8.93 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

### SECTION II: SUMMARY OF FINDINGS

#### A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There **Are No** "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

#### B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There **Are No** "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

   ☐ TNWs (new)
   ☐ Wetlands adjacent to TNWs
   ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
   ☐ Non-RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
   ☐ Impoundments of jurisdictional waters
   ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

   Non-Wetlands waters __________ Linear Feet __________ Width (ft) and/or __________ Acres

   Wetlands Acres: __________

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: ____________________________
   - Vegetation

   Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**

   Summarize rationale supporting conclusion that wetland is "adjacent"

---

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary, that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) **General Area Conditions:**

   - Watershed Size (sq mi): 49650
   - Drainage Area (sq mi): 0.40373
   - Average Annual Rainfall (in): 10
   - Average Annual Snowfall (in): 0

   (ii) **Physical Characteristics:**

   (a) **Relationship with TNW**

   - Tributary flows directly to TNW
   - Tributary flows through 4 tributaries before entering TNW
   - Project waters are 30 (or more) river miles from TNW
### General Tributary Characteristics

- **Tributary is:** Natural
  
- **Tributary properties with respect to top of bank (estimate):**
  - Average Width (ft): 
  - Average Depth (ft): 
  - Average Side Slopes: 3:1
- **Primary tributary substrate composition (check all that apply):**
  - Silts
  - Sands
  - Concrete
  - Gravel
  - Other, Explain: 
- **Tributary Condition/Stability** [e.g., highly eroding, sloughing banks. Explain: Stable.
- **Presence of Run/Riffle/Pool Complexes. Explain:** Not present.
- **Tributary Geometry:** Relatively Straight
- **Tributary Gradient (approximate average slope):** 1%

### Flow

- **Tributary Provides for:** Ephemeral Flow
- **Estimate average number of flow events in review area/year:** 2-5
- **Describe Flow Regime:** Ephemeral.
- **Other Information on Duration and Volume:** 
- **Surface Flow is:** Discrete and Confined
  
- **Subsurface Flow:** No
  
- **Dye (or other) test performed:** 

### Tributary Has (Check all that apply):

- Bed and Banks
- **OHWM (check all the apply):** OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  
- **Presence of litter and debris**
- **Destruction of terrestrial vegetation**
- **Presence of wrack line**
- **Sediment sorting**
- **Scour**
- **Multiple observed or predicted flow events**
- **Abrupt change in plant community**

- **Discontinuous?** Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- [ ] High tide line indicated by: ____________________________
- [ ] Oil or scum line along shore objects ____________________
- [ ] Fine shell or debris deposits (foreshore) ______________
- [ ] Physical markings/characteristics ______________________
- [ ] Tidal gauges ________________________________________
- [ ] Other _____________________________________________
- [ ] Mean high water mark indicated by: ____________________
- [ ] Survey to available datum ______________________________
- [ ] Physical markings __________________________________
- [ ] Vegetation lines/changes in vegetation types ____________

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: ____________________________

Identify Specific Pollutants, if known: ____________________________

(iv) Biological Characteristics. Channel supports (check all that apply):

- [ ] Riparian Corridor Characteristics: ________________________
- [ ] Wetland Fringe Characteristics: __________________________

Habitat for:

- [ ] Federally Listed Species Explain findings: __________________
- [ ] Fish/Spawn Areas Explain findings: _________________________
- [ ] Other environmentally-sensitive species Explain findings: ___________
- [ ] Aquatic/Wildlife diversity Explain: _________________________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac): _________________________
- Wetland Type, Explain: ________________________
- Wetland Quality, Explain: _______________________

Project Wetlands Cross or Serve as State Boundaries, Explain: ______________________

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: _________________________ Explain: ______________________

Surface Flow is: __________________________

Characteristics: __________________________

Subsurface Flow: __________________________ Explain Findings: __________________

(c) Wetland Adjacency Determination with Non-TNW:

- [ ] Wetland Directly Abutting Non-TNW
- [ ] Wetland Not Directly Abutting Non-TNW

- [ ] Discrete wetland hydrologic connection Explain: ___________________________
- [ ] Ecological connection Explain: ___________________________
- [ ] Separated by berm/barrier Explain: ___________________________

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: ______________________

Project Wetlands: Aerial Miles from TNW: ______________________

Flow is From: __________________________

Estimate approximate Location of Wetland within Floodplain: ______________________
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer  Characteristics (type, average width):
- Vegetation  type/percent cover. Explain:

Habitat for:
- Federally Listed Species  Explain:
- Fish/Spawn Areas  Explain:
- Other environmentally-sensitive species  Explain:
- Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- TNWs  Linear Feet: Width (ft): TNW Acres
- Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: 

- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: 
  - Provide estimates for jurisdictional waters in the review area (check all that apply):
    - Tributary waters Linear Feet: Width (ft).
    - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c. 
  - Provide estimates of jurisdictional waters within the review area (check all that apply):
    Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: 
  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW 
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C. 
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
☐ Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres): 

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: 

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres: 

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section III.C.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
☐ Other Non-wetland Waters MBR acres:
☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters 546.63 linear feet (ft), 8.87 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION I: BACKGROUND INFORMATION
A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)    July 5, 2013
B. DISTRICT OFFICE, FILE NAME, AND NUMBER Los Angeles District, File No. Pending
C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 75
State: AZ County/Parish/borough: Pinal County City: N/A
Center coordinates of site: Lat. 32.8482°N Long. -111.2599°W
Name of nearest waterbody: 
Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: Gila River between Powers Butte and Gillespie Dam
Name of watershed or Hydrologic Unit Code (HUC): 15050100
☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.
D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)
☐ Office (Desk) Determination. Date:
☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS
A. RHA SECTION 10 DETERMINATION OF JURISDICTION
There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.
☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.
B. CWA SECTION 404 DETERMINATION OF JURISDICTION
There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.
1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands
   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres: 
   c. Limits (boundaries) of Jurisdiction based on:
2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

   Identify TNW: ____________________________  □ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   | Watershed Size (sq mi): | 49650 |
   | Drainage Area (sq mi): | 0.65192 |
   | Average Annual Rainfall (in): | 10 |
   | Average Annual Snowfall (in): | 0 |

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   □ Tributary flows directly to TNW
   □ Tributary flows through _______ tributaries before entering TNW
   □ Project waters are _______ river miles from TNW
(b) General Tributary Characteristics

Tributary is: Natural
Explain: 

Tributary properties with respect to top of bank (estimate):
- Average Width (ft): 
- Average Depth (ft): 
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Cobbles
- Sands
- Concrete
- Gravel
- Substrate - Vegetation
- Muck
- Other, Explain: 

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain]: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight
Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5
Describe Flow Regime: Ephemeral.
Other Information on Duration and Volume: 

Surface Flow is: Discrete and Confined
Characteristics: 
Subsurface Flow: No
Explain: 

Dye (or other) test performed: 

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community
- Other (list): 

Discontinuous? Explain: 

If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: [ ]
- Mean High water Mark indicated by: [ ]
- oil or scum line along shore objects [ ]
- fine shell or debris deposits (foreshore) [ ]
- physical markings/characteristics [ ]
- tidal gauges [ ]
- other [ ]

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: [ ]

Identify Specific Pollutants, if known: [ ]

- Wetland Fringe Characteristics: [ ]

Habitat for:

- Federally Listed Species Explain findings: [ ]
- Fish/Spawn Areas Explain findings: [ ]
- Other environmentally-sensitive species Explain findings: [ ]
- Aquatic/Wildlife diversity Explain: [ ]

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac): [ ]
- Wetland Type, Explain: [ ]
- Wetland Quality, Explain: [ ]

Project Wetlands Cross or Serve as State Boundaries, Explain: [ ]

(b) General Flow Relationship with Non-TNW:

- Wetland Flow is: [ ]
- Surface Flow is: [ ]

Characteristics: [ ]

Subsurface Flow: [ ]

Explain Findings: [ ]

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW [ ]
- Wetland Not Directly Abutting Non-TNW [ ]

- Discrete wetland hydrologic connection Explain: [ ]
- Ecological connection Explain: [ ]
- Separated by berm/barrier Explain: [ ]

(d) Proximity (Relationship) to TNW

- Project Wetlands: River Miles from TNW: [ ]
- Project Wetlands: Aerial Miles from TNW: [ ]

Flow is From: [ ]

Estimate approximate Location of Wetland within Floodplain: [ ]
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explanation

Identify specific pollutants, if known:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer  Characteristics (type, average width):
- Vegetation  type/percent cover. Explain:
- Habitat for:
  - Federally Listed Species  Explain:
  - Fish/Spawn Areas  Explain:
  - Other environmentally-sensitive species  Explain:
  - Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

   Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs
   - Linear Feet: Width (ft): TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: Width (ft):
       - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
       - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
   - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.
Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters linear feet: width (ft):
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

- Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.
- Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant
  - Office Concurs with data sheets/delineation report
  - Office Does Not Concur with data sheets/delineation report

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:  Drainage Feature  
State: AZ  
County/Parish/borough: Pinal County  
City: N/A  
Center coordinates of site: Lat. 32.8482°N  
Long. -111.2599°W

Name of nearest waterbody:  
Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  
Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request

☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:  
☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There ☐ Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There ☐ Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters  Linear Feet  Width (ft) and/or Acres
      Wetlands Acres:  

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW: ________________ □ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.03083
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

     (a) Relationship with TNW

     □ Tributary flows directly to TNW
     ☑ Tributary flows through 4 tributaries before entering TNW

     Project waters are 30 (or more) river miles from TNW
**Feature ID:** 76

**U.S Army Corps of Engineers**

Project waters are river miles from tributary to RPW:

Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:

Project waters are aerial (straight) miles from tributary to RPW:

Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW:

Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

### (b) General Tributary Characteristics

Tributary is: Natural

Explain:

Tributary properties with respect to top of bank (estimate):

- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):

- Silts
- Sands
- Concrete
- Muck
- Cobbles
- Gravel
- Substrate - Vegetation
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

### (c) Flow

Tributary Provides for: Ephemeral Flow

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined

Characteristics:

Subsurface Flow: No

Explain:

- Dye (or other) test performed:

Tributary Has (Check all that apply):

- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community

Other (list):

- Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: ____________
- Mean High water Mark indicated by: ____________
- oil or scum line along shore objects
- fine shell or debris deposits (foreshore)
- physical markings/characteristics
- tidal gauges
- other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: ____________

Identify Specific Pollutants, if known: ____________

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: ____________
- Wetland Fringe Characteristics: ____________

Habitat for:

- Federally Listed Species Explain findings: ____________
- Fish/Spawn Areas Explain findings: ____________
- Other environmentally -sensitive species Explain findings: ____________
- Aquatic/Wildlife diversity Explain: ____________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

Wetland Size (ac): ____________
Wetland Type, Explain: ____________
Wetland Quality, Explain: ____________

Project Wetlands Cross or Serve as State Boundaries, Explain: ____________

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: ____________ Explain: ____________
Surface Flow is: ____________
Characteristics: ____________
Subsurface Flow: ____________ Explain Findings: ____________

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW
  - Discrete wetland hydrologic connection Explain: ____________
  - Ecological connection Explain: ____________
  - Separated by berm/barrier Explain: ____________

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: ____________
Project Wetlands: Aerial Miles from TNW: ____________
Flow is From: ____________
Estimate approximate Location of Wetland within Floodplain: ____________
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

☐ Riparian Buffer Characteristics (type, average width):

☐ Vegetation type/percent cover. Explain:

Habitat for:

☐ Federally Listed Species Explain:

☐ Fish/Spawn Areas Explain:

☐ Other environmentally-sensitive species Explain:

☐ Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs Linear Feet: __________ Width (ft): __________ TNW Acres __________
   - Wetlands adjacent to TNWs: Acres: __________

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: __________
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: __________
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: __________ Width (Ft): __________
       - Other non-wetland waters: Acres: __________

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       Length (Linear Feet): __________ Width (feet): __________ Acres: __________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: __________
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: __________
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: 

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale: 
Length (linear feet): Acres: 

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters 

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- [ ] Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft): 
- [ ] Other Non-wetland Waters MBR acres: 
- [ ] Wetlands MBR acres: 

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- [✓] Non-wetland waters 612.90 linear feet, 7.65 width (ft) 
- [ ] Other waters acres 
- [ ] Wetlands acres 

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 77

State: AZ  County/Parish/borough: Pinal  City: N/A

Center coordinates of site: Lat. 32.8482°N  Long. -111.2599°W

Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: 

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:

☒ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

   ☐ TNWs (new)
   ☐ Wetlands adjacent to TNWs
   ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
   ☐ Non-RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
   ☐ Impoundments of jurisdictional waters
   ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

   Non-Wetlands waters  Linear Feet  Width (ft) and/or  Acres
   Wetlands Acres:

   c.Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☒ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW: ___________  □ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

(i) General Area Conditions:

| Watershed Size (sq mi): | 49650 |
| Drainage Area (sq mi):  | 0.02655 |
| Average Annual Rainfall (in): | 10 |
| Average Annual Snowfall (in): | 0 |

(ii) Physical Characteristics:

(a) Relationship with TNW

☐ Tributary flows directly to TNW □ Tributary flows through _____ tributaries before entering TNW

Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW: 
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: 
Project waters are aerial (straight) miles from tributary to RPW: 
Project waters cross or serve as state boundaries. Explain: 
Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain: 

Tributary properties with respect to top of bank (estimate):
Average Width (ft): 
Average Depth (ft): 
Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Cobbles
- Gravel
- Substrate - Vegetation
- Other, Explain: 

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume: 

Surface Flow is: Discrete and Confined Characteristics: 
Subsurface Flow: No Explain: 

☐ Dye (or other) test performed: 

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community

Other (list): 

☐ Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: ____________  
- Mean High water Mark indicated by: ____________  
- oil or scum line along shore objects  
- fine shell or debris deposits (foreshore)  
- physical markings/characteristics  
- tidal gauges  
- other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: ____________

Identify Specific Pollutants, if known:

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: ____________
- Wetland Fringe Characteristics: ____________

Habitat for:

- Federally Listed Species Explain findings: ____________
- Fish/Spawn Areas Explain findings: ____________
- Other environmentally sensitive species Explain findings: ____________
- Aquatic/Wildlife diversity Explain: ____________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac): ____________
- Wetland Type, Explain: ____________
- Wetland Quality, Explain: ____________

Project Wetlands Cross or Serve as State Boundaries, Explain: ____________

(b) General Flow Relationship with Non-TNW:

- Wetland Flow is: ____________ Explain: ____________
- Surface Flow is: ____________

Characteristics: ____________

Subsurface Flow: ____________ Explain Findings: ____________

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW

Discrete wetland hydrologic connection Explain: ____________
Ecological connection Explain: ____________
Separated by berm/barrier Explain: ____________

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: ____________
Project Wetlands: Aerial Miles from TNW: ____________

Flow is From: ____________

Estimate approximate Location of Wetland within Floodplain: ____________
(ii) Chemical Characteristics:
Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer Characteristics (type, average width):
- Vegetation type/percent cover. Explain:

Habitat for:
- Federally Listed Species Explain:
- Fish/Spawn Areas Explain:
- Other environmentally-sensitive species Explain:
- Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

### D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. **TNWs and Adjacent Wetlands.**  Check all that apply and provide size estimates in review area:

<table>
<thead>
<tr>
<th></th>
<th>TNWs Linear Feet:</th>

4. **Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.**

|   | Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands. |

|   | Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: |

|   | Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: |

Provide acreage estimates for jurisdictional wetland in the review area: Acres: |

5. **Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW**

|   | Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C. |

Provide acreage estimates for jurisdictional wetland in the review area: Acres: |

6. **Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.**
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): ______ Acres: ______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- [ ] Non wetland-Waters (i.e., rivers, streams): linear feet: ______ width (ft): ______
- [ ] Other Non-wetland Waters MBR acres: ______
- [ ] Wetlands MBR acres: ______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- [ ] Non-wetland waters 863.15 linear feet (ft), 6.56 width (ft)
- [ ] Other waters
- [ ] Wetlands

SECTON IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 78

State: AZ  
County/Parish/borough: Pinal County  
City: N/A

Center coordinates of site:  
Lat. 32.8482°N  
Long. -111.2599°W

Name of nearest waterbody:

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:

Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g. offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:  
☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   
a. Indicate presence of water of U.S. in review area (Check all the apply):
   ☐ TNWs (new)
   ☐ Wetlands adjacent to TNWs
   ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
   ☐ Non-RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
   ☐ Impoundments of jurisdictional waters
   ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

   Non-Wetlands waters Linear Feet Width (ft) and/or Acres

   Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW: □ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a TNW that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.27461
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   □ Tributary flows directly to TNW
   ✔ Tributary flows through 4 tributaries before entering TNW
   Project waters are 30 (or more) river miles from TNW
**Feature ID:** 78

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT Nexus DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

   - TNWs Linear Feet: Width (ft): TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs

   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     Provide estimates for jurisdictional waters in the review area (check all that apply):
     - Tributary waters Linear Feet: Width (ft).
     - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   Provide estimates of jurisdictional waters within the review area (check all that apply):
   Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW
       Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
   Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
6. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
☐ Other Non-wetland Waters MBR acres: 
☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters linear feet (ft), width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

**A. RHA SECTION 10 DETERMINATION OF JURISDICTION**

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

**B. CWA SECTION 404 DETERMINATION OF JURISDICTION**

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters _______ Linear Feet _______ Width (ft) and/or _______ Acres

      Wetlands Acres: _______

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs
   The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________________ ☐ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)
   This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

   The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

   A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

   If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

☐ TNWs Linear Feet: _______ Width (ft): _______ TNW Acres _______
☐ Wetlands adjacent to TNWs: Acres: _______

2. RPWs that flow directly or indirectly into TNWs

☐ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: _______

☐ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: _______

Provide estimates for jurisdictional waters in the review area (check all that apply):

☐ Tributary waters Linear Feet: _______ Width (ft): _______ Acres: _______
☐ Other non-wetland waters: Acres: _______

3. Non-RPWs that flow directly or indirectly into TNWs.

☐ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

Provide estimates of jurisdictional waters within the review area (check all that apply):

Length (Linear Feet): _______ Width (feet): _______ Acres: _______

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

☐ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
   ☐ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: _______

   ☐ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: _______

Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

☐ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): __________  Acres: __________

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): __________ linear feet: __________ width (ft): __________
- Other Non-wetland Waters MBR __________ acres: __________
- Wetlands MBR __________ acres: __________

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):
- Non-wetland waters __________ linear feet (ft), __________ width (ft)
- Other waters __________ acres
- Wetlands __________ acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

- Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.
- Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant
  - Office Concurs with data sheets/delineation report
  - Office Does Not Concur with data sheets/delineation report
- Data Sheets Prepared by the Corps
- Corps Navigable Water Study
- US Geological Survey Hydrologic Atlas
  - USGS NHD Data
  - USGS 8 and 12 digit HUC Maps
- US Geological Survey Map(s) Scale and Quad Name:
  - Cactus Forest, Eloy North, Picacho Pass, Picacho Reservoir, Picacho Reservoir SE, Red Rock, and Valley Farms 7.5-Minute Quadrangles
Feature ID: 79

Other Information, Please Specify:

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)    July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER    Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 8

State: AZ    County/Parish/borough: Pinal County    City: N/A

Center coordinates of site: Lat. 32.8482°N    Long. -111.2599°W

Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:    ☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):

☐ TNWs (new)
☐ Wetlands adjacent to TNWs
☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
☐ Non-RPWs that flow directly or indirectly into TNWs
☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
☐ Impoundments of jurisdictional waters
☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

Non-Wetlands waters Linear Feet    Width (ft) and/or Acres

Wetlands Acres: 

c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

   Identify TNW: ____________________________  □ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary and that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.54810
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

      (a) Relationship with TNW

         □ Tributary flows directly to TNW
         ☑ Tributary flows through 4 tributaries before entering TNW

         Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:
Identify flow route to TNW
Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
Average Width (ft):
Average Depth (ft):
Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Cobbles
- Gravel
- Substrate - Vegetation
- Other, Explain:

Tributary Condition/ Stability [e.g., highly eroding, sloughing banks. Explain: Stable.
Presence of Run/Riffle/Pool Complexes. Explain: Not present.
Tributary Geometry: Relatively Straight
Tributary Gradient (approximate average slope): 1%

(c) Flow:
Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5
Describe Flow Regime: Ephemeral.
Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:
Subsurface Flow: No Explain:

Dye (or other) test performed:

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community
  - Other (list):

Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: 
- Mean High water Mark indicated by: 
- oil or scum line along shore objects
- fine shell or debris deposits (foreshore)
- physical markings/characteristics
- tidal gauges
- other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: 

Identify Specific Pollutants, if known:

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: 
- Wetland Fringe Characteristics: 

Habitat for:

- Federally Listed Species Explain findings: 
- Fish/Spawn Areas Explain findings: 
- Other environmentally-sensitive species Explain findings: 
- Aquatic/Wildlife diversity Explain: 

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac):
- Wetland Type, Explain: 
- Wetland Quality, Explain: 

Project Wetlands Cross or Serve as State Boundaries, Explain: 

(b) General Flow Relationship with Non-TNW:

- Wetland Flow is: Explain: 
- Surface Flow is: 

Characteristics: 

Subsurface Flow: Explain Findings: 

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW

Discrete wetland hydrologic connection Explain: 
- Ecological connection Explain: 
- Separated by berm/barrier Explain: 

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: 
Project Wetlands: Aerial Miles from TNW: 

Flow is From: 

Estimate approximate Location of Wetland within Floodplain: 

Hi tide line indicated by: 
Mean High water Mark indicated by: 

- survey to available datum
- physical markings
- vegetation lines/changes in vegetation types

- oil or scum line along shore objects
- fine shell or debris deposits (foreshore)
- physical markings/characteristics
- tidal gauges
- other
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

☐ Riparian Buffer  Characteristics (type, average width):

☐ Vegetation type/percent cover. Explain:

Habitat for:

☐ Federally Listed Species  Explain:

☐ Fish/Spawn Areas  Explain:

☐ Other environmentally-sensitive species  Explain:

☐ Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g., between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

☐ TNWs Linear Feet: ______ Width (ft): ______ TNW Acres ______

☐ Wetlands adjacent to TNWs: Acres: ______

2. RPWs that flow directly or indirectly into TNWs

☐ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: ______

☐ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: ______

Provide estimates for jurisdictional waters in the review area (check all that apply):

☐ Tributary waters Linear Feet: ______ Width (ft): ______

☐ Other non-wetland waters: Acres: ______

3. Non-RPWs that flow directly or indirectly into TNWs.

☐ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

Provide estimates of jurisdictional waters within the review area (check all that apply):

Length (Linear Feet): ______ Width (feet): ______ Acres: ______

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

☐ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

☐ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: ______

☐ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: ______

Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

☐ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: ______ width (ft): ______
☐ Other Non-wetland Waters MBR acres: ______
☐ Wetlands MBR acres: ______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 6512.70 linear feet (ft), 5.62 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☑ Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.
☑ Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant

☐ Office (Desk) Determination. Date:  
☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters [ ] Linear Feet [ ] Width (ft) and/or [ ] Acres
      Wetlands Acres: [ ]

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: 
   ☐ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary, but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.04495
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         ☐ Tributary flows directly to TNW
         ☑ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
# (b) General Tributary Characteristics

**Tributary is:** Natural

**Tributary properties with respect to top of bank (estimate):**

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

   Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

   This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

☐ TNWs  Linear Feet:  Width (ft):  TNW Acres
☐ Wetlands adjacent to TNWs:  Acres:

2. RPWs that flow directly or indirectly into TNWs

☐ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

☐ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

Provide estimates for jurisdictional waters in the review area (check all that apply):

☐ Tributary waters  Linear Feet:  Width (ft).
☐ Other non-wetland waters:  Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

☐ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c. Provide estimates of jurisdictional waters within the review area (check all that apply):

Length (Linear Feet):  Width (feet):  Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

☐ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

☐ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

☐ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW.

Provide acreage estimates for jurisdictional wetland in the review area:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

☐ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C. Provide acreage estimates for jurisdictional wetland in the review area:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C..

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet):  
Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet:  
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters 698.03 linear feet (ft), 12.76 width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:  Drainage Feature 81

State: AZ  County/Parish/borough: Pinal City: N/A

Center coordinates of site: Lat. 32.8482°N Long. -111.2599°W

Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date: 
☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TWN**
   - Identify TNW: ___________________________  □ Vegetation
   - Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   - Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
   - Watershed Size (sq mi): 49650
   - Drainage Area (sq mi): 0.02405
   - Average Annual Rainfall (in): 10
   - Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
   - □ Tributary flows directly to TNW
   - ✓ Tributary flows through [4] tributaries before entering TNW
   - Project waters are [30 (or more)] river miles from TNW
81

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

   - TNWs
     - Linear Feet:  
     - Width (ft):  
     - TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs

   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters
         - Linear Feet:  
         - Width (Ft):
       - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet):  
       - Width (feet):  
       - Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:

     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: 

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres: 

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft): 
- Other Non-wetland Waters MBR acres: 
- Wetlands MBR acres: 

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters linear feet (ft), width (ft) 
- Other waters acres 
- Wetlands acres 

SECTIONS IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER

Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature  82

State: AZ  County/Parish/borough: Pinal County  City: N/A

Center coordinates of site: Lat. 32.8482°N  Long. -111.2599°W

Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:

☒ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

   ☐ TNWs (new)
   ☐ Wetlands adjacent to TNWs
   ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
   ☐ Non-RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
   ☐ Impoundments of jurisdictional waters
   ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

   Non-Wetlands waters  Linear Feet  Width (ft) and/or Acres

   Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☒ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW:

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

(i) General Area Conditions:

| Watershed Size (sq mi): | 49650 |
| Drainage Area (sq mi): | 0.00603 |
| Average Annual Rainfall (in): | 10 |
| Average Annual Snowfall (in): | 0 |

(ii) Physical Characteristics:

(a) Relationship with TNW

| Tributary flows directly to TNW | ☐ |
| Tributary flows through | ☑ 4 tributaries before entering TNW |
| Project waters are | 30 (or more) river miles from TNW |
Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural

Tributary properties with respect to top of bank (estimate):
- Average Width (ft): 
- Average Depth (ft): 
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Cobble
- Bedrock
- Gravel
- Substrate - Vegetation

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain:]
- Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Describe Flow Regime: Ephemeral.

Surface Flow is: Discrete and Confined

Subsurface Flow: No

Dye (or other) test performed: 

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community

Other (list): 

Discontinuous? Explain: 

Feature ID: 82
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: 
- oil or scum line along shore objects
- fine shell or debris deposits (foreshore)
- physical markings/characteristics
- tidal gauges
- other

Mean High water Mark indicated by:
- survey to available datum
- physical markings
- vegetation lines/changes in vegetation types

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:
Wetland acres in total being considered in cumulative analysis:
Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g., between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.
Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs
   - Wetlands adjacent to TNWs

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.
   
   Provide estimates of jurisdictional waters within the review area (check all that apply):
   - Length (Linear Feet): Width (ft): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:

   Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

   Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): [ ] Acres: [ ]

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: [ ] width (ft): [ ]
- Other Non-wetland Waters MBR: acres: [ ]
- Wetlands MBR: acres: [ ]

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- [ ] Non-wetland waters: 555.85 linear feet (ft), 5.69 width (ft)
- [ ] Other waters: acres
- [ ] Wetlands: acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

State: AZ  
County/Parish/borough: Pinal County  
City: N/A

Determine Center coordinates of site:  
Lat. 32.8482°N  
Long. -111.2599°W

Determine Name of nearest waterbody: 
Gila River between Powers Butte and Gillespie Dam

Determine Name of watershed or Hydrologic Unit Code (HUC):  
15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request

☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:

☒ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329 in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☐ TNWs (new)

      ☐ Wetlands adjacent to TNWs

      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs

      ☐ Non-RPWs that flow directly or indirectly into TNWs

      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs

      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs

      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs

      ☐ Impoundments of jurisdictional waters

      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters Linear Feet Width (ft) and/or Acres

      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☒ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________________ □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.00370
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW
   □ Tributary flows directly to TNW
   ✔ Tributary flows through 4 tributaries before entering TNW
   Project waters are 30 (or more) river miles from TNW

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs Linear Feet: Width (ft): TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: Width (Ft).
       - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
   - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): _______ Acres: _______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

□ Non wetland-Waters (i.e., rivers, streams): linear feet: _______ width (ft): _______
□ Other Non-wetland Waters MBR acres: _______
□ Wetlands MBR acres: _______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters linear feet (ft), _______ width (ft) _______
☐ Other waters acres: _______
☐ Wetlands acres: _______

SECTIONS IV: DATA SOURCES

SECTION II: SUMMARY OF FINDINGS
A. RHA SECTION 10 DETERMINATION OF JURISDICTION
There ☐ "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.
☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.
B. CWA SECTION 404 DETERMINATION OF JURISDICTION
There ☐ "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters ___________ Linear Feet ___________ Width (ft) and/or ___________ Acres
      Wetlands Acres: ___________

   c. Limits (boundaries) of Jurisdiction based on:
      2. Non-Regulated Waters/Wetlands (check if applicable):
         ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
         Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.04014
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      □ Tributary flows directly to TNW
      ✔ Tributary flows through 4 tributaries before entering TNW
      Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:
Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics
Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
Average Width (ft): 
Average Depth (ft): 
Average Side Slopes: 3:1
Primary tributary substrate composition (check all that apply):
- [ ] Silts
- [ ] Sands
- [ ] Concrete
- [ ] Muck
- [ ] Cobbles
- [ ] Gravel
- [ ] Substrate - Vegetation
- [ ] Other, Explain:

Tributary Condition/ Stability [e.g., highly eroding, sloughing banks. Explain: Stable.
Presence of Run/Riffle/Pool Complexes. Explain: Not present.
Tributary Geometry: Relatively Straight
Tributary Gradient (approximate average slope): 1%

(c) Flow:
Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5
Describe Flow Regime: Ephemeral.
Other Information on Duration and Volume:
Surface Flow is: Discrete and Confined Characteristics: 
Subsurface Flow: No Explain:
[ ] Dye (or other) test performed:

Tributary Has (Check all that apply):
- [ ] Bed and Banks
- [ ] OHWM (check all the apply): OHWM Indicators:
  - [ ] Clear, natural line impressed on the bank
  - [ ] Changes in soil character
  - [ ] Shelving
  - [ ] Vegetation matted down, bent or absent
  - [ ] Leaf litter disturbed or washed away
  - [ ] Sediment deposition
  - [ ] Water staining
- [ ] Presence of litter and debris
- [ ] Destruction of terrestrial vegetation
- [ ] Presence of wrack line
- [ ] Sediment sorting
- [ ] Scour
- [ ] Multiple observed or predicted flow events
- [ ] Abrupt change in plant community
Other (list):
[ ] Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by:
- Mean High water Mark indicated by:
- oil or scum line along shore objects
- fine shell or debris deposits (foreshore)
- physical markings/characteristics
- tidal gauges

- Wetland Type, Explain:
- Wetland Quality, Explain:

Project Wetlands Cross or Serve as State Boundaries, Explain:

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: Explain:

Surface Flow is:

Characteristics:

Subsurface Flow: Explain Findings:

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW

- Discrete wetland hydrologic connection Explain:
- Ecological connection Explain:
- Separated by berm/barrier Explain:

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW:

Project Wetlands: Aerial Miles from TNW:

Flow is From:

Estimate approximate Location of Wetland within Floodplain:
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics; etc.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

☐ Riparian Buffer Characteristics (type, average width):

☐ Vegetation type/percent cover. Explain:

Habitat for:

☐ Federally Listed Species Explain:

☐ Fish/Spawn Areas Explain:

☐ Other environmentally-sensitive species Explain:

☐ Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?

• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?

• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs
   - Linear Feet: [ ] Width (ft): [ ] TNW Acres [ ]
   - Wetlands adjacent to TNWs: Acres: [ ]

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: [ ]
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: [ ] Width (ft): [ ]
       - Other non-wetland waters: Acres: [ ]

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     Length (Linear Feet): [ ] Width (feet): [ ] Acres: [ ]

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
       - Provide acreage estimates for jurisdictional wetland in the review area: [ ]

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: [ ]

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
APPROVED JURISDICTIONAL DETERMINATION FORM
U.S Army Corps of Engineers

Feature ID: 84

☐ Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section III.C.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams) linear feet: width (ft):
☐ Other Non-wetland Waters MBR acres:
☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 582.91 linear feet, 7.28 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

Additional Comments to Support JD:
SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 85  
State: AZ  
County/Parish/borough: Pinal County  
City: N/A
  
Center coordinates of site: Lat. 32.8482°N Long. -111.2599°W

Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☒ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date: 
☒ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☒ TNWs (new)
      ☒ Wetlands adjacent to TNWs
      ☒ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☒ Non-RPWS that flow directly or indirectly into TNWs
      ☒ Wetlands directly abutting RPWS that flow directly or indirectly into TNWs
      ☒ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☒ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☒ Impoundments of jurisdictional waters
      ☒ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters Linear Feet Width (ft) and/or Acres

      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

   ☒ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: 
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.82207
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         □ Tributary flows directly to TNW
         ☑ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
Average Width (ft):
Average Depth (ft):
Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Gravel
- Cobble
- Bedrock
- Substrate - Vegetation
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:
Subsurface Flow: No Explain:

Dye (or other) test performed:

Tributary Has (Check all that apply):

- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community

Discontinuous? Explain:
Feature ID: 85

U.S. Army Corps of Engineers

APPROVED JURISDICTIONAL DETERMINATION FORM

If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- [ ] High tide line indicated by: ____________________________
- [ ] Oil or scum line along shore objects
- [ ] Fine shell or debris deposits (foreshore)
- [ ] Physical markings/characteristics
- [ ] Tidal gauges
- [ ] Other

- [ ] Mean high water mark indicated by:
- [ ] Survey to available datum
- [ ] Physical markings
- [ ] Vegetation lines/changes in vegetation types

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):
Explain: __________________________________________________________

Identify Specific Pollutants, if known:
_________________________________________________________________

(iv) Biological Characteristics. Channel supports (check all that apply):

- [ ] Riparian Corridor Characteristics: ____________________________
- [ ] Wetland Fringe Characteristics: ______________________________

Habitat for:

- [ ] Federally Listed Species Explain findings: _______________________
- [ ] Fish/Spawn Areas Explain findings: ______________________________
- [ ] Other environmentally sensitive species Explain findings: _______
- [ ] Aquatic/Wildlife diversity Explain: ______________________________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:
- [ ] Wetland Size (ac): ______________________
- [ ] Wetland Type, Explain: ______________________
- [ ] Wetland Quality, Explain: ______________________

Project Wetlands Cross or Serve as State Boundaries, Explain: ________________

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: ______________________ Explain: ______________________

Surface Flow is: ______________________

Characteristics: ______________________________________________________

Subsurface Flow: ______________________ Explain Findings: ________________

(c) Wetland Adjacency Determination with Non-TNW:

- [ ] Wetland directly abutting Non-TNW
- [ ] Wetland Not Directly Abutting Non-TNW

- [ ] Discrete wetland hydrologic connection Explain: ______________________
- [ ] Ecological connection Explain: ______________________
- [ ] Separated by berm/barrier Explain: ______________________

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: ______________________

Project Wetlands: Aerial Miles from TNW: ______________________

Flow is From: ______________________

Estimate approximate Location of Wetland within floodplain: ________________
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics; etc.).

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer Characteristics (type, average width): 
- Vegetation type/percent cover. Explain:

Habitat for:
- Federally Listed Species Explain:
- Fish/Spawn Areas Explain:
- Other environmentally-sensitive species Explain:
- Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

- All wetland(s) being considered in cumulative analysis: 
- Wetland acres in total being considered in cumulative analysis: 

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands.  Check all that apply and provide size estimates in review area:

      Wetlands Acres: _______  
   c. Limits (boundaries) of Jurisdiction based on:  

2. Non-Regulated Waters/Wetlands (check if applicable):  
☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:  
   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________________ □ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.00603
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

       (a) Relationship with TNW

       □ Tributary flows directly to TNW
       ☑ Tributary flows through 4 tributaries before entering TNW

       Project waters are 30 (or more) river miles from TNW
Feature ID: 86

APPROVED JURISDICTIONAL DETERMINATION FORM

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

☐ TNWs Linear Feet: __________ Width (ft): __________ TNW Acres __________

☐ Wetlands adjacent to TNWs: Acres: __________

2. RPWs that flow directly or indirectly into TNWs

☐ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: __________

☐ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: __________

Provide estimates for jurisdictional waters in the review area (check all that apply):

☐ Tributary waters Linear Feet: __________ Width (ft): __________ Acres: __________

☐ Other non-wetland waters: Acres: __________

3. Non-RPWs that flow directly or indirectly into TNWs.

☐ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.

Provide estimates of jurisdictional waters within the review area (check all that apply):

Length (Linear Feet): __________ Width (feet): __________ Acres: __________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

☐ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

☐ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: __________

☐ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: __________

Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

☐ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- [ ] Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- [ ] Other Non-wetland Waters MBR acres:
- [ ] Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- [x] Non-wetland waters linear feet, width (ft)
- [ ] Other waters acres
- [ ] Wetlands acres

SECTION IV: DATA SOURCES

Additional Comments to Support JD:
**SECTION I: BACKGROUND INFORMATION**

**A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)**
- July 5, 2013

**B. DISTRICT OFFICE, FILE NAME, AND NUMBER**
- Los Angeles District, File No. Pending

**C. PROJECT LOCATION AND BACKGROUND INFORMATION:**
- **Drainage Feature 87**
  - **State:** AZ
  - **County/Parish/borough:** Pinal County
  - **City:** N/A
  - **Center coordinates of site:** Lat. 32.8482°N, Long. -111.2599°W

**Name of nearest waterbody:**
- Gila River between Powers Butte and Gillespie Dam

**Name of watershed or Hydrologic Unit Code (HUC):**
- 15050100

- ☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
- ☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

**D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)**
- ☐ Office (Desk) Determination. **Date:**
- ☑ Field Determination. **Date(s):** 10/2012

**SECTION II: SUMMARY OF FINDINGS**

**A. RHA SECTION 10 DETERMINATION OF JURISDICTION**
- There **Are No** "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.
- ☐ Waters subject to the ebb and flow of the tide.
- ☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

**B. CWA SECTION 404 DETERMINATION OF JURISDICTION**
- There **Are No** "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.
  1. **Waters of the U.S.**
     a. **Indicate presence of water of U.S. in review area (Check all the apply):**
        - ☐ TNWs (new)
        - ☐ Wetlands adjacent to TNWs
        - ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
        - ☐ Non-RPWs that flow directly or indirectly into TNWs
        - ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
        - ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
        - ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
        - ☐ Impoundments of jurisdictional waters
        - ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

     b. **Identify (estimate) size of waters of the U.S. in the review area**
        - Non-Wetlands waters ___________ Linear Feet
        - Width (ft) and/or ___________ Acres
        - Wetlands Acres: ___________

     c. **Limits (boundaries) of Jurisdiction based on:**

  2. **Non-Regulated Waters/Wetlands (check if applicable):**
     - ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
     - **Explanation:** Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: 
   □ Vegetation 
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.06525
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         □ Tributary flows directly to TNW
         ☑ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
**Feature ID:** 87

**U.S Army Corps of Engineers**

Project waters are crossed or serve as state boundaries. Explain:  

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

### (b) General Tributary Characteristics

Tributary is: Natural  
Explain:  

Tributary properties with respect to top of bank (estimate):  
- Average Width (ft):  
- Average Depth (ft):  
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):  
- [ ] Silts  
- [ ] Sands  
- [ ] Concrete  
- [ ] Muck  
- [ ] Cobbles  
- [ ] Gravel  
- [ ] Substrate - Vegetation  
- Other, Explain:  

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain:  
Stable.

Presence of Run/Riffle/Pool Complexes. Explain:  
Not present.

Tributary Geometry:  
- Relatively Straight

Tributary Gradient (approximate average slope):  
1%

### (c) Flow:

Tributary Provides for:  
- Ephemeral Flow

Estimate average number of flow events in review area/year:  
2-5  
Describe Flow Regime:  
Ephemeral.

Other Information on Duration and Volume:  

Surface Flow is:  
- Discrete and Confined

Subsurface Flow:  
- No  
Explain:  

Dye (or other) test performed:  

Tributary Has (Check all that apply):  

- [ ] Bed and Banks  
- [ ] OHWM (check all the apply): OHWM Indicators:  
  - [ ] Clear, natural line impressed on the bank  
  - [ ] Changes in soil character  
  - [ ] Shelving  
  - [ ] Vegetation matted down, bent or absent  
  - [ ] Leaf litter disturbed or washed away  
  - [ ] Sediment deposition  
  - [ ] Water staining  
  - Presence of litter and debris  
  - Destruction of terrestrial vegetation  
  - Presence of wrack line  
  - Sediment sorting  
  - Scour  
  - Multiple observed or predicted flow events  
  - Abrupt change in plant community

Other (list):  

[ ] Discontinuous?  
Explain:  

If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: __________
- Mean High water Mark indicated by: __________
- oil or scum line along shore objects
- fine shell or debris deposits (foreshore)
- physical markings/characteristics
- tidal gauges
- other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: __________

Identify Specific Pollutants, if known: __________

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: __________
- Wetland Fringe Characteristics: __________

Habitat for:

- Federally Listed Species Explain findings: __________
- Fish/Spawn Areas Explain findings: __________
- Other environmentally -sensitive species Explain findings: __________
- Aquatic/Wildlife diversity Explain: __________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac): __________
- Wetland Type, Explain: __________
- Wetland Quality, Explain: __________

Project Wetlands Cross or Serve as State Boundaries, Explain: __________

(b) General Flow Relationship with Non-TNW:

- Wetland Flow is: __________
- Surface Flow is: __________

Characteristics: __________

Subsurface Flow: __________

Explain Findings: __________

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW

- Discrete wetland hydrologic connection Explain: __________
- Ecological connection Explain: __________
- Separated by berm/barrier Explain: __________

(d) Proximity (Relationship) to TNW

- Project Wetlands: River Miles from TNW: __________
- Project Wetlands: Aerial Miles from TNW: __________

Flow is From: __________

Estimate approximate Location of Wetland within Floodplain: __________
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain:

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer Characteristics (type, average width): Explain:
- Vegetation type/percent cover. Explain:
- Habitat for:
  - Federally Listed Species Explain:
  - Fish/Spawn Areas Explain:
  - Other environmentally-sensitive species Explain:
  - Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

☐ TNWs  Linear Feet: _______  Width (ft): _______  TNW Acres: _______

☐ Wetlands adjacent to TNWs: Acres: _______

2. RPWs that flow directly or indirectly into TNWs

☐ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: _______

☐ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: _______

Provide estimates for jurisdictional waters in the review area (check all that apply):

☐ Tributary waters  Linear Feet: _______  Width (ft): _______

☐ Other non-wetland waters: Acres: _______

3. Non-RPWs that flow directly or indirectly into TNWs.

☐ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

Provide estimates of jurisdictional waters within the review area (check all that apply):

Length (Linear Feet): _______  Width (feet): _______  Acres: _______

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

☐ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

☐ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: _______

☐ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: _______

Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

☐ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C..

Provide estimates for jurisdictional wetland in the review area (in acres): 

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: 

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale: 
Length (linear feet): Acres: 

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters 

Explain finding of no Significant Nexus: See Section III.C. 

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft): 
Other Non-wetland Waters MBR acres: 
Wetlands MBR acres: 

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters linear feet (ft), width (ft) 
☑ Other waters acres 
☑ Wetlands acres 

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION
   There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.
   ☐ Waters subject to the ebb and flow of the tide.
   ☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION
   There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

   1. Waters of the U.S.
      a. Indicate presence of water of U.S. in review area (Check all the apply):
         ☐ TNWs (new)
         ☐ Wetlands adjacent to TNWs
         ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
         ☐ Non-RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
         ☐ Impoundments of jurisdictional waters
         ☐ Isolated (interstate or intrastate) waters, including isolated wetlands
      b. Identify (estimate) size of waters of the U.S. in the review area
         Non-Wetlands waters Linear Feet Width (ft) and/or Acres
         Wetlands Acres:
      c. Limits (boundaries) of Jurisdiction based on:

   2. Non-Regulated Waters/Wetlands (check if applicable):
      ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TW
   Identify TW:
   □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TW
   (i) General Area Conditions:
   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 1.40236
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
   (a) Relationship with TW
   □ Tributary flows directly to TW
   ✔ Tributary flows through 4 tributaries before entering TW
   Project waters are 30 (or more) river miles from TW
Project waters are river Miles from tributary to RPW:

Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:

Project waters are aerial (straight) miles from tributary to RPW:

Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural

Tributary properties with respect to top of bank (estimate):
- Average Width (ft): 
- Average Depth (ft): 
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Cobble
- Gravel
- Substrate - Vegetation
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain]: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Surface Flow is: Discrete and Confined

Subsurface Flow: No

Dye (or other) test performed: 

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community

Other (list): 

Discontinuous? Explain:

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

☐ Riparian Buffer Characteristics (type, average width):

☐ Vegetation type/percent cover. Explain:

Habitat for:

☐ Federally Listed Species Explain:

☐ Fish/Spawn Areas Explain:

☐ Other environmentally-sensitive species Explain:

☐ Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g., between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs Linear Feet: Width (ft): TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: Width (ft).
       - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW
       - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): ______ Acres: ______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters
Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: ______ width (ft): ______
☐ Other Non-wetland Waters MBR acres: ______
☐ Wetlands MBR acres: ______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters linear feet (ft), ______ acres ______
☐ Other waters acres ______
☐ Wetlands acres ______

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:  
Drainage Feature 

State: AZ  
County/Parish/borough: Pinal County  
City: N/A

Center coordinates of site:  
Lat. 32.8482°N  
Long. -111.2599°W

Name of nearest waterbody: 
Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: 

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date: 
☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters Linear Feet Width (ft) and/or Acres

      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ___________________________ ☐ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.22524
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         ☐ Tributary flows directly to TNW
         ☑ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- [ ] Silts
- [ ] Sands
- [ ] Concrete
- [ ] Muck
- [ ] Cobbles
- [ ] Gravel
- [ ] Substrate - Vegetation
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), support habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

   Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

   This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- TNWs Linear Feet: Width (ft): TNW Acres
- Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
  - Provide estimates for jurisdictional waters in the review area (check all that apply):
    - Tributary waters Linear Feet: Width (Ft).
    - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
  - Provide estimates of jurisdictional waters within the review area (check all that apply):
    - Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters linear feet (ft), width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

- Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.
- Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant
  - Office Concurs with data sheets/delineation report
  - Office Does Not Concur with data sheets/delineation report

- Data Sheets Prepared by the Corps
- Corps Navigable Water Study
- US Geological Survey Hydrologic Atlas
  - USGS NHD Data
  - USGS 8 and 12 digit HUC Maps
- US Geological Survey Map(s) Scale and Quad Name:
  - Cactus Forest, Eloy North, Picacho Pass, Picacho Reservoir, Picacho Reservoir SE, Red Rock, and Valley Farms 7.5-Minute Quadrangles
Approved Jurisdictional Determination Form

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  

C. PROJECT LOCATION AND BACKGROUND INFORMATION:  Drainage Feature  

State: AZ  
County/Parish/borough: Pinal County  
City: N/A  

Center coordinates of site: Lat. 32.8482°N  Long. 111.2599°W  

Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam  

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  

Name of watershed or Hydrologic Unit Code (HUC): 15050100  

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request  
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc.) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)  

☐ Office (Desk) Determination. Date:  
☐ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION  

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.  

☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION  

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.  

1. Waters of the U.S.  

   a. Indicate presence of water of U.S. in review area (Check all the apply):  
      ☐ TNWs (new)  
      ☐ Wetlands adjacent to TNWs  
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
      ☐ Non-RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
      ☐ Impoundments of jurisdictional waters  
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands  

   b. Identify (estimate) size of waters of the U.S. in the review area  
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres  
      Wetlands Acres: 

   c. Limits (boundaries) of Jurisdiction based on:  

2. Non-Regulated Waters/Wetlands (check if applicable):  

   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:  

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________________ ☐ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.00364
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         ☐ Tributary flows directly to TNW
         ☑ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
**Feature ID:** 9

<table>

**Identify flow route to TNW**

Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

### (b) General Tributary Characteristics

- **Tributary is:** Natural
  - Explain: 

  Tributary properties with respect to top of bank (estimate):
  - Average Width (ft):
  - Average Depth (ft):
  - Average Side Slopes: 3:1

  Primary tributary substrate composition (check all that apply):
  - Silts
  - Sands
  - Concrete
  - Muck
  - Cobble
  - Gravel
  - Substrate - Vegetation
  - Other, Explain: 

  **Tributary Condition/Stability** [e.g., highly eroding, sloughing banks. Explain:]
  - Stable.

  **Presence of Run/Riffle/Pool Complexes.**
  - Explain: Not present.

  **Tributary Geometry:**
  - Relatively Straight

  **Tributary Gradient (approximate average slope):**
  - 1%

### (c) Flow:

- **Tributary Provides for:** Ephemeral Flow
- **Estimate average number of flow events in review area/year:** 2-5

  **Describe Flow Regime:** Ephemeral.

  **Other Information on Duration and Volume:**

- **Surface Flow is:** Discrete and Confined
  - Characteristics:
- **Subsurface Flow:** No
  - **Explain:** 

- **Dye (or other) test performed:** 

- **Tributary Has (Check all that apply):**
  - Bed and Banks
  - **OHWM (check all the apply):**
  - OHWM Indicators:
    - Clear, natural line impressed on the bank
    - Changes in soil character
    - Shelving
    - Vegetation matted down, bent or absent
    - Leaf litter disturbed or washed away
    - Sediment deposition
    - Water staining
  
  **Other (list):**

- **Discontinuous?**
  - Explain: 

  **Presence of litter and debris**
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community

- **Other (list):**
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: [ ]
- Mean high water Mark indicated by: [ ]
- Oil or scum line along shore objects [ ]
- Fine shell or debris deposits (foreshore) [ ]
- Physical markings/characteristics [ ]
- Tidal gauges [ ]
- Other [ ]

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):
 Explain: [ ]

Identify Specific Pollutants, if known:

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics:
- Wetland Fringe Characteristics:

Habitat for:

- Federally Listed Species Explain findings:
- Fish/Spawn Areas Explain findings:
- Other environmentally-sensitive species Explain findings:
- Aquatic/Wildlife diversity Explain:

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:
- Wetland Size (ac):
- Wetland Type, Explain:
- Wetland Quality, Explain:

Project Wetlands Cross or Serve as State Boundaries, Explain:

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: Explain:
Surface Flow is:
Characteristics:
Subsurface Flow: Explain Findings:

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW
  - Discrete wetland hydrologic connection Explain:
  - Ecological connection Explain:
  - Separated by berm/barrier Explain:

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW:
Project Wetlands: Aerial Miles from TNW:
Flow is From:
Estimate approximate Location of Wetland within Floodplain:
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer Characteristics (type, average width):
- Vegetation type/percent cover. Explain:

Habitat for:
- Federally Listed Species Explain:
- Fish/Spawn Areas Explain:
- Other environmentally-sensitive species Explain:
- Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

   Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

   This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

   - TNWs Linear Feet: Width (ft): TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs

   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: Width (Ft).
       - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet:
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters linear feet (ft), width (ft):
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

Additional Comments to Support JD:
APPROVED JURISDICTIONAL DETERMINATION FORM
U.S. Army Corps of Engineers

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD) July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:

Drainage Feature 90

State: AZ
County/Parish/borough: Pinal
City: N/A

Center coordinates of site: Lat. 32.8482°N Long. -111.2599°W

Name of nearest waterbody: 

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:

Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date: 
☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICATION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICATION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ___________________________ ☐ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 2.02691
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
      (a) Relationship with TNW
         ☐ Tributary flows directly to TNW
         ☑ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
(b) General Tributary Characteristics

Tributary is: Natural

Tributary properties with respect to top of bank (estimate):
- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Pebbles
- Sands
- Concrete
- Gravel
- Muck
- Substrate - Vegetation
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.]

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Surface Flow is: Discrete and Confined

Subsurface Flow: No

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis: 

Wetland acres in total being considered in cumulative analysis: 

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs Linear Feet: ___________ Width (ft): ___________ TNW Acres: ___________
   - Wetlands adjacent to TNWs: Acres: ___________

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: ___________
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: ___________
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: ___________ Width (Ft): ___________ Acres: ___________
       - Other non-wetland waters: Acres: ___________

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       Length (Linear Feet): ___________ Width (feet): ___________ Acres: ___________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: ___________
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: ___________
      - Provide acreage estimates for jurisdictional wetland in the review area: Acres: ___________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: ___________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters 1464.76 linear feet (ft), 11.70 width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

- Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

   ☐ TNWs (new)  
   ☐ Wetlands adjacent to TNWs  
   ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
   ☐ Non-RPWs that flow directly or indirectly into TNWs  
   ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
   ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
   ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
   ☐ Impoundments of jurisdictional waters  
   ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

   Non-Wetlands waters Linear Feet Width (ft) and/or Acres  
   Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ___________________________  □ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
   - Watershed Size (sq mi): 49650
   - Drainage Area (sq mi): 0.02498
   - Average Annual Rainfall (in): 10
   - Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
   - □ Tributary flows directly to TNW
   - ☑ Tributary flows through ___ tributaries before entering TNW
   - Project waters are 30 (or more) river miles from TNW
(b) General Tributary Characteristics

Tributary is: Natural

Tributary properties with respect to top of bank (estimate):
- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Cobble
- Bedrock
- Sands
- Concrete
- Gravel
- Substrate - Vegetation

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain:] Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined

Subsurface Flow: No

Dye (or other) test performed: 

Tributary Has (Check all that apply):

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, rearing, and other processes for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

### D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. **TNWs and Adjacent Wetlands.** Check all that apply and provide size estimates in review area:
   - [ ] TNWs
   - [ ] Wetlands adjacent to TNWs

2. **RPWs that flow directly or indirectly into TNWs**
   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - [ ] Tributary waters
       - [ ] Other non-wetland waters

3. **Non-RPWs that flow directly or indirectly into TNWs.**
   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet):
     - Width (feet):

4. **Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.**
   - [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
   - Provide acreage estimates for jurisdictional wetland in the review area:

5. **Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW**
   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
   - Provide acreage estimates for jurisdictional wetland in the review area:

6. **Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.**
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres): __________

7. Impoundments of jurisdictional waters.
Demonstration of Jurisdiction: __________

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): ______ Acres: ______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- [ ] Non wetland-Waters (i.e., rivers, streams): linear feet: ______ width (ft): ______
- [ ] Other Non-wetland Waters MBR acres: ______
- [ ] Wetlands MBR acres: ______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters linear feet: 571.87 width (ft): 5.34
☐ Other waters acres: ______
☐ Wetlands acres: ______

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION
A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 92  
State: AZ  
County/Parish/borough: Pinal County  
City: N/A  
Center coordinates of site: Lat. 32.8482°N Long. -111.2599°W  
Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam  
Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  
Name of watershed or Hydrologic Unit Code (HUC): 15050100  
☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request  
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)  
☐ Office (Desk) Determination. Date:  
☒ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS
A. RHA SECTION 10 DETERMINATION OF JURISDICTION  
There  Are No  "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION  
There  Are No  "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):  
      ☐ TNWs (new)  
      ☐ Wetlands adjacent to TNWs  
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
      ☐ Non-RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
      ☐ Impoundments of jurisdictional waters  
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands
   b. Identify (estimate) size of waters of the U.S. in the review area  
      Non-Wetlands waters  Linear Feet Width (ft) and/or Acres  
      Wetlands Acres:  
   c. Limits (boundaries) of Jurisdiction based on:  

2. Non-Regulated Waters/Wetlands (check if applicable):  
   ☐ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:  
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

   Identify TNW: ___________________________ □ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650

   Drainage Area (sq mi): 0.03396

   Average Annual Rainfall (in): 10

   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   □ Tributary flows directly to TNW

   □ Tributary flows through ________ tributaries before entering TNW

   Project waters are ________ river miles from TNW
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Cobble
- Gravel
- Substrate - Vegetation
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:

Subsurface Flow: No Explain:

Dye (or other) test performed:

Tributary Has (Check all that apply):

- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community

Other (list): Other (list):

Discontinuous? Explain:
(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: 

Identify Specific Pollutants, if known: 

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics:
- Wetland Fringe Characteristics:

Habitat for:

- Federally Listed Species Explain findings:
- Fish/Spawn Areas Explain findings:
- Other environmentally-sensitive species Explain findings:
- Aquatic/Wildlife diversity Explain:

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac): 
- Wetland Type, Explain:
- Wetland Quality, Explain:

Project Wetlands Cross or Serve as State Boundaries, Explain: 

(b) General Flow Relationship with Non-TNW:

- Wetland Flow is: Explain:
- Surface Flow is:
  - Characteristics: 
- Subsurface Flow: Explain Findings: 

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Not Directly Abutting Non-TNW
- Discrete wetland hydrologic connection Explain: 
- Ecological connection Explain: 
- Separated by berm/barrier Explain: 

(d) Proximity (Relationship) to TNW

- Project Wetlands: River Miles from TNW: 
- Project Wetlands: Aerial Miles from TNW: 
- Flow is From: 
- Estimate approximate Location of Wetland within Floodplain:
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- □ Riparian Buffer  Characteristics (type, average width): 
- □ Vegetation  type/percent cover. Explain:

Habitat for:

- □ Federally Listed Species  Explain:
- □ Fish/Spawn Areas  Explain:
- □ Other environmentally-sensitive species  Explain:
- □ Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

### D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. **TNWs and Adjacent Wetlands.** Check all that apply and provide size estimates in review area:

<table>
<thead>
<tr>
<th>TNWs</th>
<th>Linear Feet:</th>
<th>Width (ft):</th>
<th>TNW Acres</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wetlands adjacent to TNWs:</td>
<td>Acres:</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

2. **RPWs that flow directly or indirectly into TNWs**

   | Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: |
   | Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: |

   Provide estimates for jurisdictional waters in the review area (check all that apply):

   | Tributary waters | Linear Feet: | Width (Ft): |
   | Other non-wetland waters: | Acres: |

3. **Non-RPWs that flow directly or indirectly into TNWs.**

   | Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C. |

   Provide estimates of jurisdictional waters within the review area (check all that apply):

   | Length (Linear Feet): | Width (feet): | Acres: |

4. **Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.**

   | Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands. |
   | Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: |
   | Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW |

   Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. **Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW**

   | Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C. |

   Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. **Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.**
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): _______ Acres: _______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: _______ width (ft): _______
☐ Other Non-wetland Waters MBR acres: _______
☐ Wetlands MBR acres: _______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters 599.03 linear feet (ft), 3.78 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☐ Field Determination.  
  Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands
   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters  
      Linear Feet  
      Width (ft) and/or  
      Acres
      Wetlands Acres:
   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☐ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
   Explain: Drains are ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: 
   - □ Vegetation
   - Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   - Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e., tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary, that wetland is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   - **(i) General Area Conditions:**
     - Watershed Size (sq mi): 49650
     - Drainage Area (sq mi): 0.12917
     - Average Annual Rainfall (in): 10
     - Average Annual Snowfall (in): 0
   - **(ii) Physical Characteristics:**
     - □ Tributary flows directly to TNW
     - ✔ Tributary flows through 4 tributaries before entering TNW
     - Project waters are 30 (or more) river miles from TNW
**APPROVED JURISDICTIONAL DETERMINATION FORM**

**U.S Army Corps of Engineers**

Project waters are [ ] river

River Miles from tributary to RPW:

Project waters are [ ] 30 (or more) aerial (straight) miles from tributary to TNW:

Project waters are [ ] aerial (straight) miles from tributary to RPW:

Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

### (b) General Tributary Characteristics

**Tributary is:** Natural

**Explain:**

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?, size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?

• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?

• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gilspie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs
   - Linear Feet: Width (ft): TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: Width (Ft).
       - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally”. Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
       - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

### 7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

#### E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): ______ Acres: ______

#### F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- [ ] Non wetland-Waters (i.e., rivers, streams): linear feet: ______ width (ft): ______
- [ ] Other Non-wetland Waters MBR acres: ______
- [ ] Wetlands MBR acres: ______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- [x] Non-wetland waters 543.26 linear feet (ft), 7.81 width (ft)
- [ ] Other waters acres
- [ ] Wetlands acres

### SECTION IV: DATA SOURCES

#### A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)   July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER   Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:  Drainage Feature 94

- State: AZ
- County/Parish/borough: Pinal County
- City: N/A

- Center coordinates of site: Lat. 32.8482"N   Long. -111.2599"W

- Name of nearest waterbody:
- Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: Gila River between Powers Butte and Gillespie Dam

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)
- Office (Desk) Determination. Date:
- Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWS that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW: ________________________________

□ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e., tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland, the significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650

   Drainage Area (sq mi): 0.66153

   Average Annual Rainfall (in): 10

   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   □ Tributary flows directly to TNW

   ✔ Tributary flows through 4 tributaries before entering TNW

   Project waters are 30 (or more) river miles from TNW
**Feature ID:** APPROVED JURISDICTIONAL DETERMINATION FORM  
**U.S Army Corps of Engineers**

Project waters are river Miles from tributary to RPW:  
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:  
Project waters are aerial (straight) miles from tributary to RPW:  
Project waters cross or serve as state boundaries. Explain:  

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

**(b) General Tributary Characteristics**

Tributary is: Natural  
Explain:  

Tributary properties with respect to top of bank (estimate):  
Average Width (ft):  
Average Depth (ft):  
Average Side Slopes: 3:1  
Primary tributary substrate composition (check all that apply):  
- Silts  
- Sands  
- Concrete  
- Muck  
- Gravel  
- Substrate - Vegetation  
Other, Explain:  

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.  
Presence of Run/Riffle/Pool Complexes. Explain: Not present.  
Tributary Geometry: Relatively Straight  
Tributary Gradient (approximate average slope): 1%  

**(c) Flow**

Tributary Provides for: Ephemeral Flow  
Estimate average number of flow events in review area/year: 2-5  
Describe Flow Regime: Ephemeral.  
Other Information on Duration and Volume:  

Surface Flow is: Discrete and Confined  
Characteristics:  
Subsurface Flow: No  
Explain:  

Dye (or other) test performed:  

Tributary Has (Check all that apply):  
- Bed and Banks  
- OHWM (check all the apply): OHWM Indicators:  
  - Clear, natural line impressed on the bank  
  - Changes in soil character  
  - Shelving  
  - Vegetation matted down, bent or absent  
  - Leaf litter disturbed or washed away  
  - Sediment deposition  
  - Water staining  
Other (list):  

Discontinuous? Explain:  

If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

3. Characteristics of all wetlands adjacent to the tributary (if any)
All wetland(s) being considered in cumulative analysis:
Wetland acres in total being considered in cumulative analysis:
Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION
A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.
Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.
Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- [ ] TNWs Linear Feet: Width (ft): TNW Acres
- [ ] Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs

- [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

- [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

  - Provide estimates for jurisdictional waters in the review area (check all that apply):
    - [ ] Tributary waters Linear Feet: Width (Ft).
    - [ ] Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

- [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

  Provide estimates of jurisdictional waters within the review area (check all that apply):
  Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:

    - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

  Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters linear feet (ft), width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

- Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.
- Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant
- Office Concurs with data sheets/delineation report
- Office Does Not Concur with data sheets/delineation report
- Data Sheets Prepared by the Corps
- Corps Navigable Water Study
- US Geological Survey Hydrologic Atlas
  - USGS NHD Data
  - USGS 8 and 12 digit HUC Maps
- US Geological Survey Map(s) Scale and Quad Name: Cactus Forest, Eloy North, Picacho Pass, Picacho Reservoir, Picacho Reservoir SE, Red Rock, and Valley Farms 7.5-Minute Quadrangles

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date: 
☐ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________________  □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a TNW that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 1.05578
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         □ Tributary flows directly to TNW
         ☑ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
Feature ID: 95

U.S. Army Corps of Engineers

Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
  Average Width (ft):
  Average Depth (ft):
  Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):

-硅酸盐
-鹅卵石
-砾石
-砾石床
-沙子
-混凝土
-泥
-其他，解释：

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.]
Presence of Run/Riffle/Pool Complexes. Explain: Not present.
Tributary Geometry: Relatively Straight
Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5
Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:
Subsurface Flow: No Explain:

Dye (or other) test performed: Explain:

Tributary Has (Check all that apply):

- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shingle
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining

Other (list):

- Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: 
- Mean High water Mark indicated by: 
- oil or scum line along shore objects
- fine shell or debris deposits (foreshore)
- physical markings/characteristics
- tidal gauges
- other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain:

Identify Specific Pollutants, if known:

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics:
- Wetland Fringe Characteristics:

Habitat for:

- Federally Listed Species
- Fish/Spawn Areas
- Other environmentally sensitive species
- Aquatic/Wildlife diversity

Explain findings:

Findings:

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac):
- Wetland Type, Explain:
- Wetland Quality, Explain:

Project Wetlands Cross or Serve as State Boundaries, Explain:

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: 
Surface Flow is: 
Subsurface Flow: Explain Findings:

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW

- Discrete wetland hydrologic connection
- Ecological connection
- Separated by berm/barrier

Explain:

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW:
Project Wetlands: Aerial Miles from TNW:
Flow is From:

Estimate approximate Location of Wetland within Floodplain:
(ii) Chemical Characteristics:
Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).
Explain
Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):
- Riparian Buffer Characteristics (type, average width):
- Vegetation type/percent cover. Explain:
Habitat for:
- Federally Listed Species Explain:
- Fish/Spawn Areas Explain:
- Other environmentally-sensitive species Explain:
- Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)
All wetland(s) being considered in cumulative analysis:
Wetland acres in total being considered in cumulative analysis:
Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.
Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage.
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - [ ] TNWs Linear Feet: _______ Width (ft): _______ TNW Acres _______
   - [ ] Wetlands adjacent to TNWs: Acres: _______

2. RPWs that flow directly or indirectly into TNWs
   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: _______
   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: _______
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - [ ] Tributary waters Linear Feet: _______ Width (ft): _______ Acres: _______
       - [ ] Other non-wetland waters: Acres: _______

3. Non-RPWs that flow directly or indirectly into TNWs.
   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet): _______ Width (feet): _______ Acres: _______

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: _______
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: _______
       - Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
95

Feature ID:

APPROVED JURISDICTIONAL DETERMINATION FORM
U.S Army Corps of Engineers

☐ Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C..

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet):          Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet:          width (ft):          Acres:

☐ Other Non-wetland Waters MBR acres:

☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters 798.61 linear feet, 15.39 width (ft) acres

☑ Other waters acres

☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

Additional Comments to Support JD:
SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 96  
State: AZ  
County/Parish/borough: Pinal County  
City: N/A  
Center coordinates of site: Lat. 32.8482°N  
Long. -111.2599°W  
Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam  
Name of watershed or Hydrologic Unit Code (HUC): 15050100  
☑ Check if map/diagram of review are are available upon request  
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)  
☐ Office (Desk) Determination. Date:  
☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION  
There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION  
There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):  
      ☐ TNWs (new)  
      ☐ Wetlands adjacent to TNWs  
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
      ☐ Non-RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
      ☐ Impoundments of jurisdictional waters  
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands  

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres  
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):  
☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:  
   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ___________________________ □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary, that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
   - Watershed Size (sq mi): 49650
   - Drainage Area (sq mi): 0.05620
   - Average Annual Rainfall (in): 10
   - Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
   (a) Relationship with TNW
   □ Tributary flows directly to TNW
   ✔ Tributary flows through _______ tributaries before entering TNW
   Project waters are _______ (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- TNWs Linear Feet: _____ Width (ft): _____ TNW Acres: _____
- Wetlands adjacent to TNWs: Acres: _____

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: _____
- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: _____
  - Provide estimates for jurisdictional waters in the review area (check all that apply):
    - Tributary waters Linear Feet: _____ Width (ft): _____
    - Other non-wetland waters: Acres: _____

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
  - Provide estimates of jurisdictional waters within the review area (check all that apply):
    - Length (Linear Feet): _____ Width (feet): _____ Acres: _____

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: _____
  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: _____
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres: _____

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres: _____

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
☐ Other Non-wetland Waters MBR acres:
☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 1051.58 linear feet (ft), 5.03 width (ft)
☐ Other waters acres
☐ Wetlands acres

**SECTION II: SUMMARY OF FINDINGS**

**A. RHA SECTION 10 DETERMINATION OF JURISDICTION**

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

**B. CWA SECTION 404 DETERMINATION OF JURISDICTION**

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      | Non-Wetlands waters | Linear Feet | Width (ft) and/or Acres |
      |---------------------|-------------|-------------------------|
      | Wetlands Acres:     |             |                         |

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1; otherwise, see Section III.B below.

1. TNW
   Identify TNW: _____________________________ ☐ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.10613

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs  
     Linear Feet: _______ Width (ft): _______  TNW Acres: _______
   - Wetlands adjacent to TNWs: Acres: _______

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: _______
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: _______
     Provide estimates for jurisdictional waters in the review are (check all that apply):
     - Tributary waters  
       Linear Feet: _______ Width (ft): _______  Acres: _______
     - Other non-wetland waters: Acres: _______

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     Provide estimates of jurisdictional waters within the review area (check all that apply):
     Length (Linear Feet): _______  Width (feet): _______  Acres: _______

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: _______
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW _______
     Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section III.C2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams) linear feet: width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters linear feet (ft), width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION  
There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION  
There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters: Linear Feet  
      Width (ft) and/or Acres

      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   
   Identify TNW: 
   
   Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a 

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   
   (i) General Area Conditions:
   
   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 1.50972
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
   
   (a) Relationship with TNW
   
   □ Tributary flows directly to TNW
   ✔ Tributary flows through 4 tributaries before entering TNW
   
   Project waters are 30 (or more) river miles from TNW
### (b) General Tributary Characteristics

<table>
<thead>
<tr>
<th>Feature ID: 98</th>

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac): ___________________________
- Wetland Type, Explain: ___________________________
- Wetland Quality, Explain: ___________________________

Project Wetlands Cross or Serve as State Boundaries, Explain: ___________________________

(b) General Flow Relationship with Non-TNW:

- Wetland Flow is: ___________________________
- Surface Flow is: ___________________________

Characteristics: ___________________________

Subsurface Flow: ___________________________
Explain Findings: ___________________________

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW

Discrete wetland hydrologic connection Explain: ___________________________
Ecological connection Explain: ___________________________
Separated by berm/barrier Explain: ___________________________

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: ___________________________
Project Wetlands: Aerial Miles from TNW: ___________________________
Flow is From: ___________________________
Estimate approximate Location of Wetland within Floodplain: ___________________________
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain
Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

☐ Riparian Buffer Characteristics (type, average width): 

☐ Vegetation type/percent cover. Explain: 

Habitat for:

☐ Federally Listed Species Explain: 

☐ Fish/Spawn Areas Explain: 

☐ Other environmentally-sensitive species Explain: 

☐ Aquatic/Wildlife Diversity Explain: 

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis: 

Wetland acres in total being considered in cumulative analysis: 

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- TNWs
- Linear Feet: __________ Width (ft): __________ TNW Acres
- Wetlands adjacent to TNWs: Acres: __________

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: __________
- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: __________
  - Provide estimates for jurisdictional waters in the review area (check all that apply):
    - Tributary waters Linear Feet: __________ Width (ft): __________
    - Other non-wetland waters: Acres: __________

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.
  - Provide estimates of jurisdictional waters within the review area (check all that apply):
    - Length (Linear Feet): __________ Width (feet): __________ Acres: __________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: __________
  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: __________
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

The U.S. Army Corps of Engineers is responsible for the determination of jurisdiction in wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters linear feet (ft), width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

     - [ ] Impoundments of jurisdictional waters
     - [ ] Isolated (interstate or intrastate) waters, including isolated wetlands
   - [ ] Identify (estimate) size of waters of the U.S. in the review area
     - Non-Wetlands waters: Linear Feet Width (ft) and/or Acres
     - Wetlands Acres:
   - [ ] Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

- [ ] Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

  **Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.**
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW:  
   □ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are "relatively permanent waters" (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary, the wetland is considered to be a TNW if the stream is "relatively permanent" and abuts the wetland directly.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.04347
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   □ Tributary flows directly to TNW
   ✔ Tributary flows through 4 tributaries before entering TNW

   Project waters are 30 (or more) river miles from TNW.
Feature ID: 99

APPROVED JURISDICTIONAL DETERMINATION FORM
U.S Army Corps of Engineers

Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
Average Width (ft):
Average Depth (ft):
Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Cobble
- Gravel
- Substrate - Vegetation

Other, Explain:

Tributary Condition/ Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/P ool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:
Subsurface Flow: No Explain:

Dye (or other) test performed:

Tributary Has (Check all that apply):

- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community

Other (list):

- Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: [ ]
- Mean High water Mark indicated by: [ ]
- Oil or scum line along shore objects: [ ]
- Fine shell or debris deposits (foreshore): [ ]
- Physical markings/characteristics: [ ]
- Tidal gauges: [ ]
- Other: [ ]

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

- Explain:

Identify Specific Pollutants, if known:

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: [ ]
- Wetland Fringe Characteristics: [ ]

Habitat for:

- Federally Listed Species Explain findings: [ ]
- Fish/Spawn Areas Explain findings: [ ]
- Other environmentally ‐ sensitive species Explain findings: [ ]
- Aquatic/Wildlife diversity Explain: [ ]

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac): [ ]
- Wetland Type, Explain: [ ]
- Wetland Quality, Explain: [ ]

Project Wetlands Cross or Serve as State Boundaries, Explain:

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: [ ] Explain:

Surface Flow is:

- Characteristics: [ ]

Subsurface Flow: [ ] Explain Findings:

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW [ ]
- Wetland Not Directly Abutting Non-TNW [ ]
- Discrete wetland hydrologic connection Explain: [ ]
- Ecological connection Explain: [ ]
- Separated by berm/barrier Explain: [ ]

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW:

Project Wetlands: Aerial Miles from TNW:

Flow is From:

Estimate approximate Location of Wetland within Floodplain:
(ii) Chemical Characteristics:
Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain
Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer  Characteristics (type, average width):
- Vegetation type/percent cover. Explain:
- Habitat for:
  - Federally Listed Species  Explain:
  - Fish/Spawn Areas  Explain:
  - Other environmentally-sensitive species  Explain:
  - Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

- All wetland(s) being considered in cumulative analysis:
- Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

   Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

☐ TNWs Linear Feet: Width (ft): TNW Acres

☐ Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs

☐ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

☐ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

Provide estimates for jurisdictional waters in the review area (check all that apply):

☐ Tributary waters Linear Feet: Width (ft).

☐ Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

☐ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.

Provide estimates of jurisdictional waters within the review area (check all that apply):

Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

☐ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

☐ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

☐ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:

Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

☐ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet):  
Acres: 

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC.2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet:  
width (ft):  

☐ Other Non-wetland Waters MBR acres:  

☐ Wetlands MBR acres:  

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters 844.50 linear feet, 8.26 width (ft)

☐ Other waters acres

☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☑ Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.

☑ Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant
