3. **Characteristics of all wetlands adjacent to the tributary (if any)**

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. **SIGNIFICANT NEXUS DETERMINATION**

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. **Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.**

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands.  Check all that apply and provide size estimates in review area:

   - [ ] TNWs  Linear Feet:  Width (ft):  TNW Acres
   - [ ] Wetlands adjacent to TNWs:  Acres:

2. RPWs that flow directly or indirectly into TNWs

   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - [ ] Tributary waters  Linear Feet:  Width (Ft).
       - [ ] Other non-wetland waters:  Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet):  Width (feet):  Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

   - [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW
   - Provide acreage estimates for jurisdictional wetland in the review area:  Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
   - Provide acreage estimates for jurisdictional wetland in the review area:  Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- [ ] Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- [ ] Other Non-wetland Waters MBR acres:
- [ ] Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- [ ] Non-wetland waters: 328.88 linear feet (ft), 4.92 width (ft)
- [ ] Other waters acres
- [ ] Wetlands acres

SECTION IV: DATA SOURCES

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION
A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature  182

State:  AZ  County/Parish/borough:  Pinal County  City:  N/A

Center coordinates of site:  Lat.  \(32.8482^\circ N\) Long.  \(-111.2599^\circ W\)

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)
☐ Office (Desk) Determination. Date: 
✓ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS
A. RHA SECTION 10 DETERMINATION OF JURISDICTION
There are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION
There are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all that apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
✓ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   
   Identify TNW: ____________________________ □ Vegetation
   
   Summarize rationale supporting determination:
   
2. **Wetland adjacent to TNW**
   
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. **Characteristics of non-TNWs that flow directly or indirectly into TNW**

   (i) **General Area Conditions:**
   
   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.00803
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) **Physical Characteristics:**

      (a) **Relationship with TNW**

   □ Tributary flows directly to TNW
   ✔ Tributary flows through 4 tributaries before entering TNW
   Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW: 
Project waters are 30 (or more) aerial (straight) miles from tributary to TO:
Project waters are aerial (straight) miles from tributary to RPW: 
Project waters cross or serve as state boundaries. Explain: 

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain: 

Tributary properties with respect to top of bank (estimate):
- Average Width (ft): 
- Average Depth (ft): 
- Average Side Slopes: 3:1 

Primary tributary substrate composition (check all that apply):
- [ ] Silts
- [ ] Sands
- [ ] Concrete
- [ ] Muck
- [ ] Cobble
- [ ] Gravel
- [ ] Substrate - Vegetation
- Other, Explain: 

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable. 

Presence of Run/Riffle/Pool Complexes. Explain: Not present. 

Tributary Geometry: Relatively Straight 

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow 
Estimate average number of flow events in review area/year: 2-5 

Describe Flow Regime: Ephemeral. 

Other Information on Duration and Volume: 

Surface Flow is: Discrete and Confined Characteristics: 
Subsurface Flow: No Explain: 

[ ] Dye (or other) test performed: 

Tributary Has (Check all that apply):

[ ] Bed and Banks 
[ ] OHWM (check all the apply): OHWM Indicators:
- [ ] Clear, natural line impressed on the bank

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:
- Wetland Size (ac): ____________________________
- Wetland Type, Explain: ____________________________
- Wetland Quality, Explain: ____________________________

Project Wetlands Cross or Serve as State Boundaries, Explain: ____________________________

(b) General Flow Relationship with Non-TNW:

- Wetland Flow is: ____________________________
- Explain: ____________________________
- Surface Flow is: ____________________________
- Characteristics: ____________________________
- Subsurface Flow: ____________________________
- Explain Findings: ____________________________

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW
  - Discrete wetland hydrologic connection Explain: ____________________________
  - Ecological connection Explain: ____________________________
  - Separated by berm/barrier Explain: ____________________________

(d) Proximity (Relationship) to TNW

- Project Wetlands: River Miles from TNW: ____________________________
- Project Wetlands: Aerial Miles from TNW: ____________________________
- Flow is From: ____________________________
- Estimate approximate Location of Wetland within Floodplain: ____________________________
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

☐ Riparian Buffer Characteristics (type, average width):

☐ Vegetation type/percent cover. Explain:

Habitat for:

☐ Federally Listed Species Explain:

☐ Fish/Spawn Areas Explain:

☐ Other environmentally-sensitive species Explain:

☐ Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:  Drainage Feature 183

State: AZ  County/Parish/borough: Pinal County  City: N/A

Center coordinates of site: Lat. 32.8482°N  Long. -111.2599°W

Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination.  Date: 
☐ Field Determination.  Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):

☐ TNWs (new)
☐ Wetlands adjacent to TNWs
☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
☐ Non-RPWs that flow directly or indirectly into TNWs
☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
☐ Impoundments of jurisdictional waters
☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

Non-Wetlands waters Linear Feet Width (ft) and/or Acres

Wetlands Acres: 

2. Non-Regulated Waters/Wetlands (check if applicable):

☐ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain:  Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatice resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________________ ☐ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland, the determination of whether or not the standards for jurisdiction established under Rapanos have been met requires a significant nexus evaluation.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary adjacent to wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
   - Watershed Size (sq mi): 49650
   - Drainage Area (sq mi): 0.02963
   - Average Annual Rainfall (in): 10
   - Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
   (a) Relationship with TNW
   - ☑ Tributary flows directly to TNW
   - ☐ Tributary flows through _____ tributaries before entering TNW
   - Project waters are _____ (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:
Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
Average Width (ft):
Average Depth (ft):
Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- [ ] Silts
- [ ] Sands
- [ ] Concrete
- [ ] Muck
- [ ] Cobbles
- [ ] Gravel
- [ ] Substrate - Vegetation
- [ ] Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5
Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:
Subsurface Flow: No Explain:

[ ] Dye (or other) test performed:

Tributary Has (Check all that apply):
- [ ] Bed and Banks
- [ ] OHWM (check all the apply): OHWM Indicators:
  - [ ] Clear, natural line impressed on the bank
  - [ ] Changes in soil character
  - [ ] Shelving
  - [ ] Vegetation matted down, bent or absent
  - [ ] Leaf litter disturbed or washed away
  - [ ] Sediment deposition
  - [ ] Water staining
  - [ ] Presence of litter and debris
  - [ ] Destruction of terrestrial vegetation
  - [ ] Presence of wrack line
  - [ ] Sediment sorting
  - [ ] Scour
  - [ ] Multiple observed or predicted flow events
  - [ ] Abrupt change in plant community

[ ] Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: ____________________________
- Mean High water Mark indicated by: ____________________
- oil or scum line along shore objects
- fine shell or debris deposits (foreshore)
- physical markings/characteristics
- tidal gauges
- other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: ____________________________

Identify Specific Pollutants, if known: ____________________

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics:
- Wetland Fringe Characteristics:

Habitat for:

- Federally Listed Species Explain findings: ____________________________
- Fish/Spawn Areas Explain findings: ____________________________
- Other environmentally -sensitive species Explain findings: ____________________________
- Aquatic/Wildlife diversity Explain: ____________________________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac): ____________________________
- Wetland Type, Explain: ____________________________
- Wetland Quality, Explain: ____________________________

Project Wetlands Cross or Serve as State Boundaries, Explain: ____________________________

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: ____________________________ Explain: ____________________________

Surface Flow is: ____________________________

Characteristics: ____________________________

Subsurface Flow: ____________________________ Explain Findings: ____________________________

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW

- Discrete wetland hydrologic connection Explain: ____________________________
- Ecological connection Explain: ____________________________
- Separated by berm/barrier Explain: ____________________________

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: ____________________________

Project Wetlands: Aerial Miles from TNW: ____________________________

Flow is From: ____________________________

Estimate approximate Location of Wetland within Floodplain: ____________________________
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- [ ] Riparian Buffer Characteristics (type, average width):
- [ ] Vegetation type/percent cover. Explain:

Habitat for:
- [ ] Federally Listed Species Explain:
- [ ] Fish/Spawn Areas Explain:
- [ ] Other environmentally-sensitive species Explain:
- [ ] Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

**D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)**

1. **TNWs and Adjacent Wetlands.** Check all that apply and provide size estimates in review area:

   - **TNWs**
     - Linear Feet: _____ Width (ft): _____ TNW Acres: _____
   - Wetlands adjacent to TNWs: Acres: _____

2. **RPWs that flow directly or indirectly into TNWs**

   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: _____
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: _____
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: _____ Width (ft): _____ Acres: _____
       - Other non-wetland waters: Acres: _____

3. **Non-RPWs that flow directly or indirectly into TNWs.**

   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet): _____ Width (feet): _____ Acres: _____

4. **Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.**

   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: _____
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: _____
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: _____

5. **Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW**

   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: _____

6. **Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.**
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section III.C.2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
☐ Other Non-wetland Waters MBR acres:
☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters linear feet (ft), width (ft):
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

   Identify TNW: 
   □ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.00518
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   □ Tributary flows directly to TNW
   ✔ Tributary flows through 4 tributaries before entering TNW

   Project waters are 30 (or more) river miles from TNW
**Feature ID:** 184

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis: 

Wetland acres in total being considered in cumulative analysis: 

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

   ☐ TNWs      Linear Feet:    Width (ft):    TNW Acres

   ☐ Wetlands adjacent to TNWs:  Acres:

2. RPWs that flow directly or indirectly into TNWs

   ☐ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

   ☐ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

      Provide estimates for jurisdictional waters in the review area (check all that apply):

      ☐ Tributary waters     Linear Feet:    Width (ft).

      ☐ Other non-wetland waters:  Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

   ☐ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at Section III.C.

   Provide estimates of jurisdictional waters within the review area (check all that apply):

      Length (Linear Feet):    Width (feet):    Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

   ☐ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

      ☐ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

      ☐ Wetlands directly abutting an RPW where tributaries typically flow "seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW

      Provide acreage estimates for jurisdictional wetland in the review area:  Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   ☐ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

   Provide acreage estimates for jurisdictional wetland in the review area:  Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres): 

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section III.C.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- [ ] Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- [ ] Other Non-wetland Waters MBR acres:
- [ ] Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- [x] Non-wetland waters linear feet (ft), width (ft)
- [ ] Other waters acres
- [ ] Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 185

State: AZ  
County/Parish/borough: Pinal  
City: N/A

Center coordinates of site: Lat. 32.8482°N Long. -111.2599°W

Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request

☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:  
☒ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters Linear Feet Width (ft) and/or Acres

      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

   ☐ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________________  ☐ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      | Watershed Size (sq mi): | 49650 |
      | Drainage Area (sq mi):  | 0.00570 |
      | Average Annual Rainfall (in): | 10 |
      | Average Annual Snowfall (in): | 0 |

   (ii) Physical Characteristics:
      (a) Relationship with TNW
         ☐ Tributary flows directly to TNW
         ☑ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
Project waters are [ ] river Miles from tributary to RPW: Explain:
Project waters are [ ] 30 (or more) aerial (straight) miles from tributary to TNW: Explain:
Project waters are [ ] aerial (straight) miles from tributary to RPW: Explain:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

<table>
<thead>
<tr>
<th>Tributary is:</th>

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- [ ] TNWs Linear Feet: ___________ Width (ft): ___________ TNW Acres ___________
- [ ] Wetlands adjacent to TNWs: Acres: ___________

2. RPWs that flow directly or indirectly into TNWs

- [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: ___________
- [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: ___________

Provide estimates for jurisdictional waters in the review area (check all that apply):

- [ ] Tributary waters Linear Feet: ___________ Width (Ft): ___________
- [ ] Other non-wetland waters: Acres: ___________

3. Non-RPWs that flow directly or indirectly into TNWs.

- [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

Provide estimates of jurisdictional waters within the review area (check all that apply):

Length (Linear Feet): ___________ Width (feet): ___________ Acres: ___________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: ___________
  - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: ___________

Provide acreage estimates for jurisdictional wetland in the review area: Acres: ___________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetland in the review area: Acres: ___________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section III.C.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters 445.64 linear feet (ft), 3.94 width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD) 

July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER

Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:

Drainage Feature 186

State: AZ 
County/Parish/borough: Pinal County 
City: N/A

Center coordinates of site: Lat. 32.8482°N Long. -111.2599°W

Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: 

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date: 
☐ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

 a. Indicate presence of water of U.S. in review area (Check all the apply):

☐ TNWs (new)
☐ Wetlands adjacent to TNWs
☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
☐ Non-RPWs that flow directly or indirectly into TNWs
☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
☐ Impoundments of jurisdictional waters
☐ Isolated (interstate or intrastate) waters, including isolated wetlands

 b. Identify (estimate) size of waters of the U.S. in the review area

Non-Wetlands waters Linear Feet Width (ft) and/or Acres

Wetlands Acres:

 c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☐ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: __________
   - ☐ Vegetation

Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) **General Area Conditions**:

   - Watershed Size (sq mi): 49650
   - Drainage Area (sq mi): 0.82629
   - Average Annual Rainfall (in): 10
   - Average Annual Snowfall (in): 0

   (ii) **Physical Characteristics**:

   (a) **Relationship with TNW**

   - ☐ Tributary flows directly to TNW
   - ✔ Tributary flows through 4 tributaries before entering TNW
   - Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:  
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:  
Project waters are aerial (straight) miles from tributary to RPW:  
Project waters cross or serve as state boundaries. Explain:  

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

### (b) General Tributary Characteristics

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

### D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. **TNWs and Adjacent Wetlands.** Check all that apply and provide size estimates in review area:

   - □ TNWs  Linear Feet:  Width (ft):  TNW Acres
   - □ Wetlands adjacent to TNWs:  Acres:

2. **RPWs that flow directly or indirectly into TNWs**
   - □ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - □ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - □ Tributary waters  Linear Feet:  Width (Ft).
       - □ Other non-wetland waters:  Acres:

3. **Non-RPWs that flow directly or indirectly into TNWs.**
   - □ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet):  Width (feet):  Acres:

4. **Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.**
   - □ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - □ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - □ Wetlands directly abutting an RPW where tributaries typically flow "seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW
       - Provide acreage estimates for jurisdictional wetland in the review area:  Acres:

5. **Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW**
   - □ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
   - Provide acreage estimates for jurisdictional wetland in the review area:  Acres:

6. **Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.**
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
☐ Other Non-wetland Waters MBR acres:
☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters 2477.22 linear feet (ft), 7.87 width (ft)
☐ Other waters
☐ Wetlands

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☐ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW:  
   ☐ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.02996
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         ☐ Tributary flows directly to TNW
         ☑ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:
Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics
Tributary is: Natural Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)
All wetland(s) being considered in cumulative analysis:
Wetland acres in total being considered in cumulative analysis:
Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION
A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.
Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

<table>
<thead>
<tr>
<th></th>
<th>Linear Feet:</th>
<th>Width (ft):</th>

<tr>
<td>Wetlands adjacent to TNWs</td>
<td>Acres:</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and rationale indicating that tributary is perennial:

- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
  - Provide estimates for jurisdictional waters in the review area (check all that apply):
    - Tributary waters: Linear Feet: Width (Ft):
    - Other non-wetland waters: Acres:  

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
  - Provide estimates of jurisdictional waters within the review area (check all that apply):
    - Length (Linear Feet): Width (feet): Acres:  

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres:  

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres:  

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section III.C.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):

☐ Other Non-wetland Waters MBR acres:

☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters linear feet (ft), width (ft):

☐ Other waters acres:

☐ Wetlands acres:

☐ Field Determination. Date(s):  10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There  Are No  "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There  Are No  "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):

☐ TNWs (new)
☐ Wetlands adjacent to TNWs
☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
☐ Non-RPWs that flow directly or indirectly into TNWs
☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
☐ Impoundments of jurisdictional waters
☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

Non-Wetlands waters  Linear Feet  Width (ft) and/or  Acres

Wetlands Acres:  

c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☐ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain:  Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: 
   - Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   - Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. **Characteristics of non-TNWs that flow directly or indirectly into TNW**
   - **(i) General Area Conditions:**
     - Watershed Size (sq mi): 49650
     - Drainage Area (sq mi): 0.01025
     - Average Annual Rainfall (in): 10
     - Average Annual Snowfall (in): 0
   - **(ii) Physical Characteristics:**
     - **(a) Relationship with TNW**
       - ☑ Tributary flows directly to TNW
       - ☑ Tributary flows through 4 tributaries before entering TNW
       - Project waters are 30 (or more) river miles from TNW
### (b) General Tributary Characteristics

**Tributary is:** Natural  
**Explain:**

<table>
<thead>
<tr>
<th>Tributary properties with respect to top of bank (estimate):</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Average Width (ft):</strong></td>
</tr>
<tr>
<td><strong>Average Depth (ft):</strong></td>
</tr>
<tr>
<td><strong>Average Side Slopes:</strong></td>
</tr>
</tbody>
</table>

**Primary tributary substrate composition (check all that apply):**
- [ ] Silts
- [ ] Sands
- [ ] Concrete
- [ ] Muck
- [ ] Cobble
- [ ] Gravel
- [ ] Substrate - Vegetation
- [ ] Other, Explain: _Stable._

**Tributary Condition/ Stability [e.g., highly eroding, sloughing banks. Explain:]** Stable.

**Presence of Run/Riffle/Pool Complexes. Explain:** Not present.

**Tributary Geometry:** Relatively Straight

**Tributary Gradient (approximate average slope):** 1%

### (c) Flow:

**Tributary Provides for:** Ephemeral Flow  
**Describe Flow Regime:** Ephemeral.

<table>
<thead>
<tr>
<th>Other Information on Duration and Volume:</th>
</tr>
</thead>
</table>

**Estimate average number of flow events in review area/year:** 2-5

**Surface Flow is:** Discrete and Confined  
**Characteristics:**

**Subsurface Flow:** No  
**Explain:**

**Dye (or other) test performed:**

**Tributary Has (Check all that apply):**
- [ ] Bed and Banks
- [ ] OHWM (check all the apply): OHWM Indicators:
  - [ ] Clear, natural line impressed on the bank
  - [ ] Changes in soil character
  - [ ] Shelving
  - [ ] Vegetation matted down, bent or absent
  - [ ] Leaf litter disturbed or washed away
  - [ ] Sediment deposition
  - [ ] Water staining
  - [ ] Presence of litter and debris
  - [ ] Destruction of terrestrial vegetation
  - [ ] Presence of wrack line
  - [ ] Sediment sorting
  - [ ] Scour
  - [ ] Multiple observed or predicted flow events
  - [ ] Abrupt change in plant community

**Other (list):**

**Discontinuous?**  
**Explain:**
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: ____________________________
- Mean High water Mark indicated by: ____________________________
- oil or scum line along shore objects
- fine shell or debris deposits (foreshore)
- physical markings/characteristics
- tidal gauges
- other

(iii) Chemical Characteristics:

- Aquatic/Wildlife diversity Explain: ____________________________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac): ____________________________
- Wetland Type, Explain: ____________________________
- Wetland Quality, Explain: ____________________________

Project Wetlands Cross or Serve as State Boundaries, Explain: ____________________________

(b) General Flow Relationship with Non-TNW:

- Wetland Flow is: ____________________________ Explain: ____________________________
- Surface Flow is: ____________________________

Characteristics: ____________________________

Subsurface Flow: ____________________________ Explain Findings: ____________________________

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW
  - Discrete wetland hydrologic connection Explain: ____________________________
  - Ecological connection Explain: ____________________________
  - Separated by berm/barrier Explain: ____________________________

(d) Proximity (Relationship) to TNW

- Project Wetlands: River Miles from TNW: ____________________________
- Project Wetlands: Aerial Miles from TNW: ____________________________

Flow is From: ____________________________

Estimate approximate Location of Wetland within Floodplain: ____________________________
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain: __________________________________________________________________________

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer Characteristics (type, average width): __________________________________________________________________________
- Vegetation type/percent cover. Explain: __________________________________________________________________________

Habitat for:
- Federally Listed Species Explain: __________________________________________________________________________
- Fish/Spawn Areas Explain: __________________________________________________________________________
- Other environmentally-sensitive species Explain: __________________________________________________________________________
- Aquatic/Wildlife Diversity Explain: __________________________________________________________________________

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis: __________________________________________________________________________

Wetland acres in total being considered in cumulative analysis: __________________________________________________________________________

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There ☐ Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There ☐ Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   
a. Indicate presence of water of U.S. in review area (Check all the apply):
   ☐ TNWs (new)
   ☐ Wetlands adjacent to TNWs
   ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
   ☐ Non-RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
   ☐ Impoundments of jurisdictional waters
   ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area
   
   Non-Wetlands waters  Linear Feet  Width (ft) and/or Acres
   Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   
   Identify TNW: [ ]
   
   □ Vegetation
   
   Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a TNW, determination of whether or not the standards for jurisdiction established under Rapanos have been met is determined in Section III.C below.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) **General Area Conditions:**
   
   | Watershed Size (sq mi): | 49650 |
   | Drainage Area (sq mi): | 0.00299 |
   | Average Annual Rainfall (in): | 10 |
   | Average Annual Snowfall (in): | 0 |

   (ii) **Physical Characteristics:**

   (a) **Relationship with TNW**
   
   □ Tributary flows directly to TNW
   
   ✔ Tributary flows through 4 tributaries before entering TNW
   
   Project waters are 30 (or more) river miles from TNW
Project waters are 30 (or more) river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are 30 (or more) aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural
Tributary properties with respect to top of bank (estimate):
- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Cobbles
- Sands
- Concrete
- Muck
- Gravel
- Substrate - Vegetation
- Other, Explain: 

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.
Presence of Run/Riffle/Pool Complexes. Explain: Not present.
Tributary Geometry: Relatively Straight
Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5
Describe Flow Regime: Ephemeral.
Other Information on Duration and Volume:
Surface Flow is: Discrete and Confined
Subsurface Flow: No

Dye (or other) test performed:

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community
- Other (list): 
- Discontinuous? Explain: 

Feature ID: 189

If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):
- High tide line indicated by: __________________________
- Mean High water Mark indicated by: __________________________
- oil or scum line along shore objects
- fine shell or debris deposits (foreshore)
- physical markings/characteristics
- tidal gauges

(iii) Chemical Characteristics:
Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):
Explain: __________________________
Identify Specific Pollutants, if known: __________________________

(iv) Biological Characteristics. Channel supports (check all that apply):
- Riparian Corridor Characteristics: __________________________
- Wetland Fringe Characteristics: __________________________
Habitat for:
- Federally Listed Species Explain findings: __________________________
- Fish/Spawn Areas Explain findings: __________________________
- Other environmentally -sensitive species Explain findings: __________________________
- Aquatic/Wildlife diversity Explain: __________________________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:
  (a) General Wetland Characteristics
    Properties:
    - Wetland Size (ac): __________________________
    - Wetland Type, Explain: __________________________
    - Wetland Quality, Explain: __________________________
    Project Wetlands Cross or Serve as State Boundaries, Explain: __________________________
  
  (b) General Flow Relationship with Non-TNW:
    Wetland Flow is: __________________________ Explain: __________________________
    Surface Flow is: __________________________
    Characteristics: __________________________
    Subsurface Flow: __________________________ Explain Findings: __________________________
  
  (c) Wetland Adjacency Determination with Non-TNW:
    - Wetland Directly Abutting Non-TNW
    - Wetland Not Directly Abutting Non-TNW
      - Discrete wetland hydrologic connection Explain: __________________________
      - Ecological connection Explain: __________________________
      - Separated by berm/barrier Explain: __________________________
  
  (d) Proximity (Relationship) to TNW
    Project Wetlands: River Miles from TNW: __________________________
    Project Wetlands: Aerial Miles from TNW: __________________________
    Flow is From: __________________________
    Estimate approximate Location of Wetland within Floodplain: __________________________
(ii) Chemical Characteristics:
Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: etc.).
Explain
Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- □ Riparian Buffer Characteristics (type, average width):
- □ Vegetation type/percent cover. Explain:
Habitat for:
- □ Federally Listed Species Explain:
- □ Fish/Spawn Areas Explain:
- □ Other environmentally-sensitive species Explain:
- □ Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)
All wetland(s) being considered in cumulative analysis:
Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

☐ TNWs Linear Feet: _______ Width (ft): _______ TNW Acres _______

☐ Wetlands adjacent to TNWs: Acres: _______

2. RPWs that flow directly or indirectly into TNWs

☐ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: _______

☐ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: _______

Provide estimates for jurisdictional waters in the review area (check all that apply):

☐ Tributary waters Linear Feet: _______ Width (ft): _______

☐ Other non-wetland waters: Acres: _______

3. Non-RPWs that flow directly or indirectly into TNWs.

☐ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c. Provide estimates of jurisdictional waters within the review area (check all that apply): Length (Linear Feet): _______ Width (feet): _______ Acres: _______

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

☐ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

☐ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: _______

☐ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: _______

Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

☐ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C. Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Feature ID: 189

U.S. Army Corps of Engineers

Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 277.43 linear feet (ft), 4.40 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☐ Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.
☐ Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant
☐ Office Concurs with data sheets/delineation report
☐ Office Does Not Concur with data sheets/delineation report
☐ Data Sheets Prepared by the Corps
☐ Corps Navigable Water Study
☐ US Geological Survey Hydrologic Atlas
☐ USGS NHD Data
☐ USGS 8 and 12 digit HUC Maps
☐ US Geological Survey Map(s) Scale and Quad Name:
  Cactus Forest, Eloy North, Picacho Pass, Picacho Reservoir, Picacho Reservoir SE, Red Rock, and Valley Farms 7.5-Minute Quadrangles
☐ USDA Nat’l Res Conservation Service Soil Survey      Citation:
☐ National Wetlands Inventory Maps      Cite Map Name:
☐ State/Local Wetland Inventory Maps
☐ FEMA/FIRM      Maps:
☐ 100-year Floodplain Elevation is: ___________ (National Geodetic Vertical Datum of 1929)
☐ Aerial Photographs      (Name and Date): Aerials Express Phoenix 2009, BING Aerial Imagery 2011
☑ Other Photographs      (Name and Date): Ground Photos; June through July 2012, September through October 2012
☐ Previous Determinations      File No. and Date of Response Letter:
☐ Applicable/Supporting Case Law      Citation:
☐ Applicable/Supporting Scientific Literature      Citation:
              Other Information, Please Specify:

Additional Comments to Support JD:
SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 19

State: AZ  County/Parish/borough: Pinal County  City: N/A

Center coordinates of site: Lat. 32.8482°N  Long. -111.2599°W

Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc.) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☑ Field Determination.  Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There are no "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There are no "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☒ TNWs (new)
      □ Wetlands adjacent to TNWs
      □ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      □ Non-RPWs that flow directly or indirectly into TNWs
      □ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      □ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      □ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      □ Impoundments of jurisdictional waters
      □ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters _______ Linear Feet _______ Width (ft) and/or _______ Acres

      Wetlands Acres: _______

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

   ☒ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   
   Identify TNW: ______________________  □ Vegetation
   
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.02718
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   □ Tributary flows directly to TNW
   □ Tributary flows through _______ tributaries before entering TNW

   Project waters are _______ (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:  
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:  
Project waters are aerial (straight) miles from tributary to RPW:  
Project waters cross or serve as state boundaries. Explain:  

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

### (b) General Tributary Characteristics

Tributary is: Natural

Tributary properties with respect to top of bank (estimate):

- **Average Width (ft):**
- **Average Depth (ft):**
- **Average Side Slopes:** 3:1

Primary tributary substrate composition (check all that apply):

- [ ] Silts
- [ ] Sands
- [x] Concrete
- [ ] Muck
- [ ] Cobble
- [ ] Gravel
- [x] Substrate - Vegetation
- Other, Explain:  

Tributary Condition/Security [e.g., highly eroding, sloughing banks. Explain: Stable.]

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

### (c) Flow

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Describe other Information on Duration and Volume:  

Surface Flow is: Discrete and Confined

Subsurface Flow: No

- [ ] Dye (or other) test performed:

Tributary Has (Check all that apply):

- [ ] Bed and Banks
- [x] OHWM (check all the apply): OHWM Indicators:
  - [ ] Clear, natural line impressed on the bank
  - [ ] Changes in soil character
  - [x] Shelving
  - [ ] Vegetation matted down, bent or absent
  - [ ] Leaf litter disturbed or washed away
  - [ ] Sediment deposition
  - [ ] Water staining
  - Other (list):

- [ ] Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: ______________________  Mean High water Mark indicated by: ______________________
  - oil or scum line along shore objects  - survey to available datum
  - fine shell or debris deposits (foreshore)  - physical markings
  - physical markings/characteristics  - vegetation lines/changes in vegetation types
  - tidal gauges
  - other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: ______________________

Identify Specific Pollutants, if known: ______________________

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: ______________________
- Wetland Fringe Characteristics: ______________________

Habitat for:

- Federally Listed Species Explain findings: ______________________
- Fish/Spawn Areas Explain findings: ______________________
- Other environmentally -sensitive species Explain findings: ______________________
- Aquatic/Wildlife diversity Explain: ______________________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac): ______________________
- Wetland Type, Explain: ______________________
- Wetland Quality, Explain: ______________________

Project Wetlands Cross or Serve as State Boundaries, Explain: ______________________

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: ______________________ Explain: ______________________

Surface Flow is: ______________________

Characteristics: ______________________

Subsurface Flow: ______________________ Explain Findings: ______________________

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW
  - Discrete wetland hydrologic connection Explain: ______________________
  - Ecological connection Explain: ______________________
  - Separated by berm/barrier Explain: ______________________

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: ______________________

Project Wetlands: Aerial Miles from TNW: ______________________

Flow is From: ______________________

Estimate approximate Location of Wetland within Floodplain: ______________________
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics; ect.).

Explain

Identify specific pollutants, if known:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer  Characteristics (type, average width):
- Vegetation type/percent cover. Explain:

Habitat for:
- Federally Listed Species  Explain:
- Fish/Spawn Areas  Explain:
- Other environmentally-sensitive species  Explain:
- Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- TNWs: Linear Feet: __________ Width (ft): __________ TNW Acres __________
- Wetlands adjacent to TNWs: Acres: __________

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: __________
- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: __________

Provide estimates for jurisdictional waters in the review area (check all that apply):

- Tributary waters: Linear Feet: __________ Width (Ft): __________ Acres: __________
- Other non-wetland waters: Acres: __________

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

Provide estimates of jurisdictional waters within the review area (check all that apply):

Length (Linear Feet): __________ Width (feet): __________ Acres: __________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: __________
  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: __________

Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters 1190.50 linear feet (ft), 7.51 width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

- Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.
- Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION
A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD) July 5, 2013
B. DISTRICT OFFICE, FILE NAME, AND NUMBER Los Angeles District, File No. Pending
C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 190
   State: AZ  Count/Parish/borough: Pinal County  City: N/A
   Center coordinates of site: Lat. 32.8482°N  Long. -111.2599°W
   Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam
   Name of watershed or Hydrologic Unit Code (HUC): 15050100
   ☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
   ☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.
D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)
   ☐ Office (Desk) Determination. Date:
   ☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS
A. RHA SECTION 10 DETERMINATION OF JURISDICTION
   There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.
   ☐ Waters subject to the ebb and flow of the tide.
   ☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.
B. CWA SECTION 404 DETERMINATION OF JURISDICTION
   There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.
   1. Waters of the U.S.
      a. Indicate presence of water of U.S. in review area (Check all the apply):
         ☐ TNWs (new)
         ☐ Wetlands adjacent to TNWs
         ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
         ☐ Non-RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
         ☐ Impoundments of jurisdictional waters
         ☐ Isolated (interstate or intrastate) waters, including isolated wetlands
      b. Identify (estimate) size of waters of the U.S. in the review area
         Non-Wetlands waters Linear Feet Width (ft) and/or Acres
         Wetlands Acres:
      c. Limits (boundaries) of Jurisdiction based on:
   2. Non-Regulated Waters/Wetlands (check if applicable):
      ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS
A. TNWs AND WETLANDS ADJACENT TO TNWs
The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________________________________  □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)
This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.14774
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         □ Tributary flows directly to TNW
         □ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
**APPROVED JURISDICTIONAL DETERMINATION FORM**

**U.S Army Corps of Engineers**

**Project waters are**
- river Miles from tributary to RPW: [ ]
- Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: [ ]
- Project waters are aerial (straight) miles from tributary to RPW: [ ]

**Project waters cross or serve as state boundaries.** Explain: [ ]

**Identify flow route to TNW** Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

### (b) General Tributary Characteristics

**Tributary is:** Natural Explain: [ ]

**Tributary properties with respect to top of bank (estimate):**
- Average Width (ft): [ ]
- Average Depth (ft): [ ]
- Average Side Slopes: 3:1

**Primary tributary substrate composition (check all that apply):**
- [ ] Silts
- [ ] Sands
- [ ] Concrete
- [ ] Muck
- [ ] Cobbles
- [ ] Gravel
- [ ] Substrate - Vegetation

**Tributary Condition/Stability** [e.g., highly eroding, sloughing banks. Explain:] Stable.

**Presence of Run/Riffle/Pool Complexes.** Explain: Not present.

**Tributary Geometry:** Relatively Straight

**Tributary Gradient (approximate average slope):** 1%

### (c) Flow:

**Tributary Provides for:** Ephemeral Flow

**Estimate average number of flow events in review area/year:** 2-5

**Describe Flow Regime:** Ephemeral.

**Other Information on Duration and Volume:**

**Surface Flow is:** Discrete and Confined Characteristics:

**Subsurface Flow:** No Explain: [ ]

[ ] Dye (or other) test performed: [ ]

**Tributary Has (Check all that apply):**
- [ ] Bed and Banks
- [ ] OHWM (check all the apply): OHWM Indicators:
  - [ ] Clear, natural line impressed on the bank
  - [ ] Changes in soil character
  - [ ] Shelving
  - [ ] Vegetation matted down, bent or absent
  - [ ] Leaf litter disturbed or washed away
  - [ ] Sediment deposition
  - [ ] Water staining

**Other (list):** [ ]

[ ] Discontinuous? Explain: [ ]

---

**Explain:**
- Tributary is: Natural
- Averag ge Width (ft):
- Average Depth (ft):
- 3:1
- Silts Sands Concrete Cobbles Gravel Muck Bedrock Other,
- Explain: Stable.
- Presence of Run/Riffle/Pool Complexes. Explain: Not present.
- Tributary Geometry: Relatively Straight
- Tributary Gradient (approximate average slope): 1%
- Primary tributary substrate composition (check all that apply):
  - Silts
  - Sands
  - Concrete
  - Muck
  - Cobbles
  - Gravel
  - Substrate - Vegetation
  - Other, Explain: Stable.
- Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.
- Presence of Run/Riffle/Pool Complexes. Explain: Not present.
- Tributary Geometry: Relatively Straight
- Tributary Gradient (approximate average slope): 1%
- (b) General Tributary Characteristics
- Tributary is: Natural Explain: [ ]

  - Concrete
  - Muck
  - Cobbles
  - Gravel
  - Substrate - Vegetation
  - Other, Explain: Stable.
- Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.
- Presence of Run/Riffle/Pool Complexes. Explain: Not present.
- Tributary Geometry: Relatively Straight
- Tributary Gradient (approximate average slope): 1%
- Primary tributary substrate composition (check all that apply):
  - Silts
  - Sands
  - Concrete
  - Muck
  - Cobbles
  - Gravel
  - Substrate - Vegetation
  - Other, Explain: Stable.
- Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.
- Presence of Run/Riffle/Pool Complexes. Explain: Not present.
- Tributary Geometry: Relatively Straight
- Tributary Gradient (approximate average slope): 1%
- Primary tributary substrate composition (check all that apply):
  - Silts
  - Sands
  - Concrete
  - Muck
  - Cobbles
  - Gravel
  - Substrate - Vegetation
  - Other, Explain: Stable.
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: ____________________________
- Mean High water Mark indicated by: ______________________
  - oil or scum line along shore objects
  - fine shell or debris deposits (foreshore)
  - physical markings/characteristics
  - tidal gauges
  - other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: ___________________________________________

Identify Specific Pollutants, if known: ___________________________________________

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: ____________________________
- Wetland Fringe Characteristics: ____________________________

Habitat for:

- Federally Listed Species Explain findings: ____________________________
- Fish/Spawn Areas Explain findings: ____________________________
- Other environmentally sensitive species Explain findings: ____________________________
- Aquatic/Wildlife diversity Explain: ____________________________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac): ____________________________
- Wetland Type, Explain: ____________________________
- Wetland Quality, Explain: ____________________________

Project Wetlands Cross or Serve as State Boundaries, Explain: ____________________________

(b) General Flow Relationship with Non-TNW:

- Wetland Flow is: ____________________________ Explain: ____________________________
- Surface Flow is: ____________________________
  - Characteristics: ____________________________
  - Subsurface Flow: ____________________________ Explain Findings: ____________________________

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW

  - Discrete wetland hydrologic connection Explain: ____________________________
  - Ecological connection Explain: ____________________________
  - Separated by berm/barrier Explain: ____________________________

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: ____________________________

Project Wetlands: Aerial Miles from TNW: ____________________________

Flow is From: ____________________________

Estimate approximate Location of Wetland within Floodplain: ____________________________
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain:

Identify specific pollutants, if known:

(iii) Biological Characteristics. Wetland supports (check all that apply):

☐ Riparian Buffer Characteristics (type, average width):

☐ Vegetation type/percent cover. Explain:

Habitat for:

☐ Federally Listed Species Explain:

☐ Fish/Spawn Areas Explain:

☐ Other environmentally-sensitive species Explain:

☐ Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs  Linear Feet: __________ Width (ft): __________ TNW Acres __________
   - Wetlands adjacent to TNWs: Acres: __________

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: __________
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: __________
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters  Linear Feet: __________ Width (ft): __________ Acres: __________
       - Other non-wetland waters: Acres: __________

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet): __________ Width (feet): __________ Acres: __________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: __________
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: __________
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
APPROVED JURISDICTIONAL DETERMINATION FORM  
U.S Army Corps of Engineers

Feature ID: 190

☐ Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):

☐ Other Non-wetland Waters MBR acres:

☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters 1008.20 linear feet (ft), 9.20 width (ft)

☑ Other waters acres

☑ Wetlands acres

**SECTION II: SUMMARY OF FINDINGS**

**A. RHA SECTION 10 DETERMINATION OF JURISDICTION**

There **Are No** "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

**B. CWA SECTION 404 DETERMINATION OF JURISDICTION**

There **Are No** "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. **Waters of the U.S.**

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters ___________ Linear Feet ___________ Width (ft) and/or ___________ Acres

      Wetlands Acres: ___________

   c. Limits (boundaries) of Jurisdiction based on:

2. **Non-Regulated Waters/Wetlands (check if applicable):**

   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   **Explain:** Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1; otherwise, see Section III.B below.

1. TNW

Identify TNW: ___________________________  □ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting the tributary, but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

(i) General Area Conditions:

<table>
<thead>
<tr>
<th>Characteristics</th>
<th>Value</th>

(ii) Physical Characteristics:

(a) Relationship with TNW

- □ Tributary flows directly to TNW
- ✔ Tributary flows through _____ tributaries before entering TNW

Project waters are _____ (or more) river miles from TNW
Feature ID: 191

U.S Army Corps of Engineers

Project waters are river Miles from tributary to RPW:  
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:  
Project waters cross or serve as state boundaries. Explain:  

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural  

Tributary properties with respect to top of bank (estimate):
Average Width (ft):  
Average Depth (ft):  
Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts  
- Sands  
- Concrete  
- Gravel  
- Substrate - Vegetation  
- Bedrock  
- Muck  
- Other, Explain:  

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined  
Subsurface Flow: No  
Dye (or other) test performed:  

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community

Discontinuous? Explain:  

If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: ________________
- Mean High water Mark indicated by: ________________
- Oil or scum line along shore objects
- Fine shell or debris deposits (foreshore)
- Physical markings/characteristics
- Tidal gauges
- Other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Estimate approximate Location of Wetland within Floodplain: ________________
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics; etc.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

☐ Riparian Buffer  Characteristics (type, average width):

☐ Vegetation  type/percent cover. Explain:

Explain:

Habitat for:

☐ Federally Listed Species  Explain:

☐ Fish/Spawn Areas  Explain:

☐ Other environmentally-sensitive species  Explain:

☐ Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

<table>
<thead>
<tr>
<th></th>
<th>Linear Feet:</th>
<th>Width (ft):</th>
<th>TNW Acres</th>
</tr>
</thead>
<tbody>
<tr>
<td>TNWs</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Wetlands adjacent to TNWs</td>
<td>Acres:</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

  Provide estimates for jurisdictional waters in the review area (check all that apply):

<table>
<thead>
<tr>
<th></th>
<th>Linear Feet:</th>
<th>Width (ft):</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tributary waters</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Other non-wetland waters</td>
<td>Acres:</td>
<td></td>
</tr>
</tbody>
</table>

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

  Provide estimates of jurisdictional waters within the review area (check all that apply):

<table>
<thead>
<tr>
<th>Length (Linear Feet):</th>
<th>Width (feet):</th>
<th>Acres:</th>
</tr>
</thead>
</table>

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

- Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:

  Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

  Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): _______ Acres: _______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: _______ width (ft): _______

☐ Other Non-wetland Waters MBR acres: _______

☐ Wetlands MBR acres: _______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 595.72 linear feet (ft), 5.95 width (ft)

☐ Other waters acres

☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

   **Explain:** Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: [ ] Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary, the determination must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 1.19622
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         [ ] Tributary flows directly to TNW
         [ ] Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
## (b) General Tributary Characteristics

**Tributary is:** Natural  
**Explain:**

**Tributary properties with respect to top of bank (estimate):**

- **Average Width (ft):**
- **Average Depth (ft):**
- **Average Side Slopes:** 3:1

**Primary tributary substrate composition (check all that apply):**

- ☑ Silts
- ☑ Sand
- ☑ Concrete
- ☐ Muck
- ☑ Cobbles
- ☑ Gravel
- ☑ Substrate - Vegetation
- Other, **Explain:**

**Tributary Condition/STability [e.g., highly eroding, sloughing banks. Explain: Stable.**

**Presence of Run/Riffle/Pooll Complexes. Explain:** Not present.

**Tributary Geometry:** Relatively Straight

**Tributary Gradient (approximate average slope):** 1%

## (c) Flow:

**Tributary Provides for:** Ephemeral Flow

**Estimate average number of flow events in review area/year:** 2-5  
**Describe Flow Regime:** Ephemeral.

**Other Information on Duration and Volume:**

**Surface Flow is:** Discrete and Confined  
**Characteristics:**

**Subsurface Flow:** No  
**Explain:**

- ☐ Dye (or other) test performed: 

**Tributary Has (Check all that apply):**

- ☑ Bed and Banks
- ☑ OHWM (check all the apply): OHWM Indicators:
  - ☑ Clear, natural line impressed on the bank
  - ☑ Changes in soil character
  - ☑ Shelving
  - ☑ Vegetation matted down, bent or absent
  - ☑ Leaf litter disturbed or washed away
  - ☑ Sediment deposition
  - ☑ Water staining  
  - **Other (list):**

- ☐ Discontinuous?  
**Explain:**
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

Project Wetlands Cross or Serve as State Boundaries, Explain: [ ]

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: [ ] Explain: [ ]

Surface Flow is: [ ]

Characteristics: [ ]

Subsurface Flow: [ ] Explain Findings: [ ]

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW [ ]
- Wetland Not Directly Abutting Non-TNW [ ]

  - Discrete wetland hydrologic connection: [ ] Explain: [ ]
  - Ecological connection: [ ] Explain: [ ]
  - Separated by berm/berm: [ ] Explain: [ ]

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: [ ]

Project Wetlands: Aerial Miles from TNW: [ ]

Flow is From: [ ]

Estimate approximate Location of Wetland within Floodplain: [ ]
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.). Explain

Identify specific pollutants, if known:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer  Characteristics (type, average width):
- Vegetation type/percent cover. Explain: Habitat for:
  - Federally Listed Species  Explain:
  - Fish/Spawn Areas  Explain:
  - Other environmentally-sensitive species  Explain:
  - Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis: Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

   □ TNWs  Linear Feet: _ _ _ _ Width (ft): _ _ _ _ TNW Acres _ _ _ _

   □ Wetlands adjacent to TNWs: Acres: _ _ _ _

2. RPWs that flow directly or indirectly into TNWs

   □ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: _ _ _ _

   □ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: _ _ _ _

      Provide estimates for jurisdictional waters in the review area (check all that apply):
      □ Tributary waters Linear Feet: _ _ _ _ Width (Ft): _ _ _ _
      □ Other non-wetland waters: Acres: _ _ _ _

3. Non-RPWs that flow directly or indirectly into TNWs.

   □ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c. Provide estimates of jurisdictional waters within the review area (check all that apply):

      Length (Linear Feet): _ _ _ _ Width (feet): _ _ _ _ Acres: _ _ _ _

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

   □ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

      □ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

      □ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:

      Provide acreage estimates for jurisdictional wetland in the review area: Acres: _ _ _ _

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   □ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C. Provide acreage estimates for jurisdictional wetland in the review area: Acres: _ _ _ _

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Provide estimates for jurisdictional wetland in the review area (in acres):

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): ______ Acres: ______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- [ ] Non-wetland-Waters (i.e., rivers, streams): linear feet: ______ width (ft): ______
- [ ] Other Non-wetland Waters MBR acres: ______
- [ ] Wetlands MBR acres: ______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- [x] Non-wetland waters linear feet (ft), ______ width (ft) ______
- [ ] Other waters acres ______
- [ ] Wetlands acres ______

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 193

State: AZ  
County/Parish/borough: Pinal County  
City: N/A

Center coordinates of site:  
Lat. 32.8482°N  
Long. -111.2599°W

Name of nearest waterbody:  
Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  
Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:  
☐ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)  
      ☐ Wetlands adjacent to TNWs  
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
      ☐ Non-RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
      ☐ Impoundments of jurisdictional waters  
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters  ___________ Linear Feet  ___________ Width (ft) and/or  ___________ Acres
      Wetlands Acres:  ___________

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ___________  □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abutts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a TNW that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.00699
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   □ Tributary flows directly to TNW
   ✔ Tributary flows through 4 tributaries before entering TNW

   Project waters are 30 (or more) river miles from TNW
(b) General Tributary Characteristics

Tributary is: Natural

Tributary properties with respect to top of bank (estimate):
- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- [ ] Silts
- [ ] Sands
- [ ] Concrete
- [ ] Muck
- [ ] Cobble
- [ ] Gravel
- [ ] Substrate - Vegetation
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.]

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined

Subsurface Flow: No

Dye (or other) test performed: 

Tributary Has (Check all that apply):

- [ ] Bed and Banks
- [ ] OHWM (check all the apply): OHWM Indicators:
  - [ ] Clear, natural line impressed on the bank
  - [ ] Changes in soil character
  - [ ] Shelving
  - [ ] Vegetation matted down, bent or absent
  - [ ] Leaf litter disturbed or washed away
  - [ ] Sediment deposition
  - [ ] Water staining
  - Other (list):

- [ ] Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- □ High tide line indicated by: __________________________
- □ Mean High water Mark indicated by: __________________________
- □ oil or scum line along shore objects
- □ fine shell or debris deposits (foreshore)
- □ physical markings/characteristics
- □ tidal gauges
- □ other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: _______________________________________________________________________

Identify Specific Pollutants, if known: _____________________________________________

(iv) Biological Characteristics. Channel supports (check all that apply):

- □ Riparian Corridor Characteristics: ____________________________________________
- □ Wetland Fringe Characteristics: ______________________________________________

Habitat for:

- □ Federally Listed Species Explain findings: _______________________________________
- □ Fish/Spawn Areas Explain findings: ____________________________________________
- □ Other environmentally-sensitive species Explain findings: __________________________
- □ Aquatic/Wildlife diversity Explain: ______________________________________________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac): __________________________
- Wetland Type, Explain: __________________________
- Wetland Quality, Explain: __________________________

Project Wetlands Cross or Serve as State Boundaries, Explain: _________________________

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: __________________________ Explain: __________________________

Surface Flow is: __________________________________________________________________

Characteristics: __________________________

Subsurface Flow: __________________________ Explain Findings: _______________________

(c) Wetland Adjacency Determination with Non-TNW:

- □ Wetland Directly Abutting Non-TNW
- □ Wetland Not Directly Abutting Non-TNW

- □ Discrete wetland hydrologic connection Explain: __________________________
- □ Ecological connection Explain: __________________________
- □ Separated by berm/barrier Explain: __________________________

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: __________________________

Project Wetlands: Aerial Miles from TNW: __________________________

Flow is From: __________________________

Estimate approximate Location of Wetland within Floodplain: __________________________
(ii) Chemical Characteristics:
Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).
Explain
Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer Characteristics (type, average width):
- Vegetation type/percent cover. Explain:
Habitat for:
- Federally Listed Species Explain:
- Fish/Spawn Areas Explain:
- Other environmentally-sensitive species Explain:
- Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)
All wetland(s) being considered in cumulative analysis:
Wetland acres in total being considered in cumulative analysis:
Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION
A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs
   - Linear Feet: ______________ Width (ft): ______________ TNW Acres: ______________
   - Wetlands adjacent to TNWs: Acres: ______________

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: ______________
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: ______________
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: ______________ Width (Ft): ______________
       - Other non-wetland waters: Acres: ______________

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet): ______________ Width (feet): ______________ Acres: ______________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: ______________
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: ______________
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section III C2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
☐ Other Non-wetland Waters MBR acres:
☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters 251.96 linear feet (ft), 3.19 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☑ Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.
☑ Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant

☐ Office (Desk) Determination. Date:  
☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There ☐ "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.  
☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There ☐ "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.  

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):  
☐ TNWs (new)  
☐ Wetlands adjacent to TNWs  
☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
☐ Non-RPWs that flow directly or indirectly into TNWs  
☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
☐ Impoundments of jurisdictional waters  
☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area  
Non-Wetlands waters Linear Feet Width (ft) and/or Acres  
Wetlands Acres:

c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):  
☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:  
Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1; only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1; otherwise, see Section III.B below.

1. TNW

Identify TNW: ______________________ □ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a TRIBUTARY that is not a TNW, complete Section III.D.1. Only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1; otherwise, see Section III.B below.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.01640
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   □ Tributary flows directly to TNW
   □ Tributary flows through [4] tributaries before entering TNW
   □ Project waters are [30 (or more)] river miles from TNW

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

### D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. **TNWs and Adjacent Wetlands.** Check all that apply and provide size estimates in review area:
   - [ ] TNWs
   - [ ] Wetlands adjacent to TNWs
   - Linear Feet: [ ] Width (ft): [ ] TNW Acres [ ]

2. **RPWs that flow directly or indirectly into TNWs**
   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - [ ] Tributary waters
       - [ ] Other non-wetland waters
       - Linear Feet: [ ] Width (ft): [ ] Acres: [ ]

3. **Non-RPWs that flow directly or indirectly into TNWs.**
   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet): [ ] Width (feet): [ ] Acres: [ ]

4. **Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.**
   - [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: [ ]

5. **Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW**
   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: [ ]

6. **Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.**
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: 

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): ______ Acres: ______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: ______ width (ft): ______
☐ Other Non-wetland Waters MBR acres: ______
☐ Wetlands MBR acres: ______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters Acres: ______
☐ Other waters Acres: ______
☐ Wetlands Acres: ______

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☐ Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.
☐ Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant

**SECTION II: SUMMARY OF FINDINGS**

**A. RHA SECTION 10 DETERMINATION OF JURISDICTION**

There **Are No** "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

**B. CWA SECTION 404 DETERMINATION OF JURISDICTION**

There **Are No** "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
### A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: 
   - Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   - Summarize rationale supporting conclusion that wetland is "adjacent"

### B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   1. **General Area Conditions:**
      - **Watershed Size (sq mi):** 49650
      - **Drainage Area (sq mi):** 5.34043
      - **Average Annual Rainfall (in):** 10
      - **Average Annual Snowfall (in):** 0
   2. **Physical Characteristics:**
      - (a) **Relationship with TNW**
        - ☑ Tributary flows through
        - ☐ Tributary flows directly to TNW
        - Tributaries before entering TNW
        - Project waters are 30 (or more) river miles from TNW
### (b) General Tributary Characteristics

Tributary is: **Natural**

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs   Linear Feet: Width (ft): TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: Width (Ft).
       - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW
       - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C..

Provide estimates for jurisdictional wetland in the review area (in acres): 

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: 

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale: 
Length (linear feet):  Acres:  

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters 

Explain finding of no Significant Nexus:  See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams):  linear feet :  width (ft):  
- Other Non-wetland Waters MBR acres:  
- Wetlands MBR acres:  

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters  linear feet (ft),  width (ft)  
- Other waters acres  
- Wetlands acres  

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)
   ☐ Office (Desk) Determination. Date:
   ☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION
   There ☑ No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.
   ☐ Waters subject to the ebb and flow of the tide.
   ☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION
   There ☑ No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.
   1. Waters of the U.S.
      a. Indicate presence of water of U.S. in review area (Check all the apply):
         ☐ TNWs (new)
         ☐ Wetlands adjacent to TNWs
         ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
         ☐ Non-RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
         ☐ Impoundments of jurisdictional waters
         ☐ Isolated (interstate or intrastate) waters, including isolated wetlands
      b. Identify (estimate) size of waters of the U.S. in the review area
         Non-Wetlands waters Width (ft) and/or Acres
         Wetlands Acres:
      c. Limits (boundaries) of Jurisdiction based on:

   2. Non-Regulated Waters/Wetlands (check if applicable):
      ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
         Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ___________________________ ☐ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.00130
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
      (a) Relationship with TNW
         ☐ Tributary flows directly to TNW
         ✓ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
**Feature ID:** APPROVED JURISDICTIONAL DETERMINATION FORM  
U.S Army Corps of Engineers

Project waters are river Miles from tributary to RPW: 
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: 
Project waters are aerial (straight) miles from tributary to RPW: 
Project waters cross or serve as state boundaries. Explain: 

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

### (b) General Tributary Characteristics

Identify Specific Pollutants, if known:

(iv) Biological Characteristics. Channel supports (check all that apply):
- Riparian Corridor  Characteristics:
- Wetland Fringe  Characteristics:
Habitat for:
- Federally Listed Species  Explain findings:
- Fish/Spawn Areas  Explain findings:
- Other environmentally-sensitive species  Explain findings:
- Aquatic/Wildlife diversity  Explain:

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:
(a) General Wetland Characteristics
Properties:
- Wetland Size (ac):
- Wetland Type, Explain:
- Wetland Quality, Explain:
Project Wetlands Cross or Serve as State Boundaries, Explain:

(b) General Flow Relationship with Non-TNW:
- Wetland Flow is: Explain:
- Surface Flow is:
Characteristics:
- Subsurface Flow: Explain Findings:

(c) Wetland Adjacency Determination with Non-TNW:
- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW
- Discrete wetland hydrologic connection  Explain:
- Ecological connection  Explain:
- Separated by berm/barrier  Explain:

(d) Proximity (Relationship) to TNW
- Project Wetlands: River Miles from TNW:
- Project Wetlands: Aerial Miles from TNW:
- Flow is From:
- Estimate approximate Location of Wetland within Floodplain:
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain: 

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- [ ] Riparian Buffer Characteristics (type, average width): 
- [ ] Vegetation type/percent cover. Explain: 

Habitat for:
- [ ] Federally Listed Species Explain: 
- [ ] Fish/Spawn Areas Explain: 
- [ ] Other environmentally-sensitive species Explain: 
- [ ] Aquatic/Wildlife Diversity Explain: 

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis: 

Wetland acres in total being considered in cumulative analysis: 

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely deterministic of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section II.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

   - TNWs   Linear Feet:   Width (ft):   TNW Acres
   - Wetlands adjacent to TNWs:   Acres:

2. RPWs that flow directly or indirectly into TNWs

   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

      Provide estimates for jurisdictional waters in the review area (check all that apply):

      - Tributary waters   Linear Feet:   Width (Ft).
      - Other non-wetland waters:   Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

   Provide estimates of jurisdictional waters within the review area (check all that apply):

   Length (Linear Feet):   Width (feet):   Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
   - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
   - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW

      Provide acreage estimates for jurisdictional wetland in the review area:   Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

      Provide acreage estimates for jurisdictional wetland in the review area:   Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres): __________

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: __________

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale: __________

Length (linear feet): _______ Acres: _______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters __________

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: _______ width (ft): _______

☐ Other Non-wetland Waters MBR acres: _______

☐ Wetlands MBR acres: _______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters 84.80 linear feet (ft), 3.77 width (ft)

☐ Other waters acres

☐ Wetlands acres

SECTION IV: DATA SOURCES

   □ Office (Desk) Determination. Date: 
   ☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

□ Waters subject to the ebb and flow of the tide.

□ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      □ TNWs (new)
      □ Wetlands adjacent to TNWs
      □ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      □ Non-RPWs that flow directly or indirectly into TNWs
      □ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      □ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      □ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      □ Impoundments of jurisdictional waters
      □ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters Linear Feet Width (ft) and/or Acres

      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

   Identify TNW: ____________________________ ☐ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.02388
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

      (a) Relationship with TNW

         ☐ Tributary flows directly to TNW
         ☑ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW: 
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: 
Project waters are aerial (straight) miles from tributary to RPW: 
Project waters cross or serve as state boundaries. Explain: 

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain: 

Tributary properties with respect to top of bank (estimate):
Average Width (ft): 
Average Depth (ft): 
Average Side Slopes: 3:1 

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Cobbles
- Gravel
- Substrate - Vegetation
- Other, Explain: 

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.
Presence of Run/Riffle/Pool Complexes. Explain: Not present.
Tributary Geometry: Relatively Straight
Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5
Describe Flow Regime: Ephemeral.

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- TNWs
- Wetlands adjacent to TNWs

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

  Provide estimates for jurisdictional waters in the review area (check all that apply):

  - Tributary waters
  - Other non-wetland waters

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.

  Provide estimates of jurisdictional waters within the review area (check all that apply):

  Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally”. Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW

  Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

  Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres): 

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: 

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres: 

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters 

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- [ ] Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft): 
- [ ] Other Non-wetland Waters MBR acres: 
- [ ] Wetlands MBR acres: 

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- [✓] Non-wetland waters 699.89 linear feet (ft), 7.30 width (ft)
- [ ] Other waters acres
- [ ] Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

- [✓] Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.
- [✓] Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 198

State: AZ  
County/Parish/borough: Pinal  
City: N/A

Center coordinates of site:  
Lat. 32.8482°N  
Long. -111.2599°W

Name of nearest waterbody:  
Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:  
☐ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No “navigable waters of the U.S.” within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No “waters of the U.S.” within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

   ☐ TNWs (new)
   ☐ Wetlands adjacent to TNWs
   ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
   ☐ Non-RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
   ☐ Impoundments of jurisdictional waters
   ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

   Non-Wetlands waters Linear Feet Width (ft) and/or Acres
   Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☐ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: [ ] Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.07026
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         [ ] Tributary flows directly to TNW
         [ ] Tributary flows through [4] tributaries before entering TNW
         Project waters are [30 (or more)] river miles from TNW
Project waters are river Miles from tributary to RPW: 
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: 
Project waters are aerial (straight) miles from tributary to RPW: 
Project waters cross or serve as state boundaries. Explain: 
Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics
Tributary is: Natural Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

SECTION I: BACKGROUND INFORMATION
A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  July 5, 2013
B. DISTRICT OFFICE, FILE NAME, AND NUMBER  Los Angeles District, File No. Pending
C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 199
   State: AZ  County/Parish/borough: Pinal City: N/A
   Center coordinates of site: Lat. 32.8482°N  Long. -111.2599°W
   Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam
   Name of watershed or Hydrologic Unit Code (HUC): 15050100
   ✔ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
   □ Check if other sites (e.g. offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)
   □ Office (Desk) Determination. Date:  
   ✔ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS
A. RHA SECTION 10 DETERMINATION OF JURISDICTION
   There  Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.
   □ Waters subject to the ebb and flow of the tide.
   □ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION
   There  Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.
   1. Waters of the U.S.
      a. Indicate presence of water of U.S. in review area (Check all the apply):
         □ TNWs (new)
         □ Wetlands adjacent to TNWs
         □ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
         □ Non-RPWs that flow directly or indirectly into TNWs
         □ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
         □ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
         □ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
         □ Impoundments of jurisdictional waters
         □ Isolated (interstate or intrastate) waters, including isolated wetlands
      b. Identify (estimate) size of waters of the U.S. in the review area
         Non-Wetlands waters  Linear Feet  Width (ft) and/or  Acres
         Wetlands Acres:
      c. Limits (boundaries) of Jurisdiction based on:

   2. Non-Regulated Waters/Wetlands (check if applicable):
      ✔ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW: ____________________________ ☐ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.00363
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   ☐ Tributary flows directly to TNW
   ✅ Tributary flows through 4 tributaries before entering TNW

   Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

**Identify flow route to TNW**
Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

**(b) General Tributary Characteristics**

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Gravel
- Substrate - Vegetation

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain]: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

**(c) Flow**

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:

Subsurface Flow: No Explain:

Dye (or other) test performed:

Tributary Has (Check all that apply):

- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining

Presence of litter and debris
- Destruction of terrestrial vegetation
- Presence of wrack line
- Sediment sorting
- Scour
- Multiple observed or predicted flow events
- Abrupt change in plant community

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g., between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.
Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs Linear Feet: Width (ft): TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: Width (ft).
       - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
       - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
   - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): ______ Acres: ______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: ______ width (ft): ______
☐ Other Non-wetland Waters MBR: acres: ______
☐ Wetlands MBR: acres: ______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters: 387.56 linear feet (ft), 4.18 width (ft)
☐ Other waters: acres
☐ Wetlands: acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☐ Office (Desk) Determination. Date:  
☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)  
      ☐ Wetlands adjacent to TNWs  
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
      ☐ Non-RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
      ☐ Impoundments of jurisdictional waters  
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands
   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres  
      Wetlands Acres:
   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW: ________________________ ☐ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.04365
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   ☐ Tributary flows directly to TNW
   ☑ Tributary flows through 4 tributaries before entering TNW
   Project waters are 30 (or more) river miles from TNW
(b) General Tributary Characteristics

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

   - TNWs Linear Feet: Width (ft): TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs

   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: Width (ft).
       - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
       - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres): ___________

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: ___________

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale: ___________

Length (linear feet): _______ Acres: _______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: _______ width (ft): _______

☐ Other Non-wetland Waters MBR acres: _______

☐ Wetlands MBR acres: _______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters width (ft): 2.66 acres _______

☐ Other waters width (ft): _______ acres _______

☐ Wetlands width (ft): _______ acres _______

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands
   
   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters  Linear Feet  Width (ft) and/or  Acres
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☐ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: [ ] Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.00463
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         [ ] Tributary flows directly to TNW
         [ ] Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW: 
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: 
Project waters are aerial (straight) miles from tributary to RPW: 
Project waters cross or serve as state boundaries. Explain: 

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain: 

Tributary properties with respect to top of bank (estimate):

3. Characteristics of all wetlands adjacent to the tributary (if any)
All wetland(s) being considered in cumulative analysis:
Wetland acres in total being considered in cumulative analysis:
Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION
A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.
Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - [ ] TNWs
   - [ ] Wetlands adjacent to TNWs

2. RPWs that flow directly or indirectly into TNWs
   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - [ ] Tributary waters
       - [ ] Other non-wetland waters

3. Non-RPWs that flow directly or indirectly into TNWs.
   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
☐ Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres): 

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: 

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale: 
Length (linear feet):     Acres:  

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams):  linear feet:     width (ft):  
☐ Other Non-wetland Waters MBR acres:  
☐ Wetlands MBR acres:  

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters  142.06 linear feet (ft),  5.43 width (ft) 
☐ Other waters acres 
☐ Wetlands acres 

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)    July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER    Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:   Drainage Feature 200

State:   AZ    County/Parish/borough:   Pinal County    City:   N/A

Center coordinates of site:    Lat.    32.8482°N    Long.    -111.2599°W

Name of nearest waterbody:    

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:    Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC):    15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g, offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:    
☐ Field Determination. Date(s):    10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There    Are No    "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There    Are No    "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):
☐ TNWs (new)
☐ Wetlands adjacent to TNWs
☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
☐ Non-RPWs that flow directly or indirectly into TNWs
☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
☐ Impoundments of jurisdictional waters
☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

Non-Wetlands waters  Linear Feet Width (ft) and/or Acres

Wetlands Acres:    

c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain:    Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aqua-tice resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   
   Identify TNW: ________
   
   □ Vegetation
   
   Summarize rationale supporting determination:
   
2. **Wetland adjacent to TNW**
   
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   
   (i) **General Area Conditions:**

   | Watershed Size (sq mi) | 49650 |
   | Drainage Area (sq mi)   | 0.04058 |
   | Average Annual Rainfall (in) | 10 |
   | Average Annual Snowfall (in) | 0 |

   (ii) **Physical Characteristics:**

   (a) Relationship with TNW

   □ Tributary flows directly to TNW
   
   ☑ Tributary flows through __________ tributaries before entering TNW

   Project waters are 30 (or more) river miles from TNW
**General Tributary Characteristics**

3. Characteristics of all wetlands adjacent to the tributary  (if any)
All wetland(s) being considered in cumulative analysis:
Wetland acres in total being considered in cumulative analysis:
Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION
A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.
Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented in the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.
Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:
This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

### D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. **TNWs and Adjacent Wetlands.** Check all that apply and provide size estimates in review area:
   - [ ] TNWs  Linear Feet: ___ Width (ft): ___  TNW Acres ___
   - [ ] Wetlands adjacent to TNWs:  Acres: ___

2. **RPWs that flow directly or indirectly into TNWs**
   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: ___
   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: ___
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - [ ] Tributary waters  Linear Feet: ___ Width (Ft): ___
       - [ ] Other non-wetland waters:  Acres: ___

3. **Non-RPWs that flow directly or indirectly into TNWs.**
   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet): ___ Width (feet): ___  Acres: ___

4. **Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.**
   - [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: ___
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: ___
       - Provide acreage estimates for jurisdictional wetland in the review area:  Acres: ___

5. **Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW**
   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area:  Acres: ___

6. **Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.**
☐ Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres): 

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): 
Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
☐ Other Non-wetland Waters MBR acres:
☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters 2174.84 linear feet (ft), 5.75 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

#### SECTION II: SUMMARY OF FINDINGS

**A. RHA SECTION 10 DETERMINATION OF JURISDICTION**

There Are No "Navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

- **Waters subject to the ebb and flow of the tide.**
- **Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.**

**B. CWA SECTION 404 DETERMINATION OF JURISDICTION**

There Are No "Waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. **Waters of the U.S.**
   - **Indicate presence of water of U.S. in review area (Check all the apply):**
     - **TNWs (new)**
     - **Wetlands adjacent to TNWs**
     - **Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs**
     - **Non-RPWs that flow directly or indirectly into TNWs**
     - **Wetlands directly abutting RPWs that flow directly or indirectly into TNWs**
     - **Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs**
     - **Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs**
     - **Impoundments of jurisdictional waters**
     - **Isolated (interstate or intrastate) waters, including isolated wetlands**

   **b. Identify (estimate) size of waters of the U.S. in the review area**

   - **Non-Wetlands waters**
     - **Linear Feet**
     - **Width (ft) and/or**
     - **Acres**

   **Wetlands Acres:**

   **c. Limits (boundaries) of Jurisdiction based on:**

2. **Non-Regulated Waters/Wetlands (check if applicable):**
   - **Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:**

   **Explain:** Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: 
   ☐ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.15621
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         ☐ Tributary flows directly to TNW
         ☑ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
**Feature ID:** 201  

U.S Army Corps of Engineers

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs
   - Linear Feet: _______ Width (ft): _______ TNW Acres _______
   - Wetlands adjacent to TNWs: Acres: _______

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: _______
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: _______
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: _______ Width (Ft): _______ Acres: _______
       - Other non-wetland waters: Acres: _______

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet): _______ Width (feet): _______ Acres: _______

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: _______
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: _______
     - Provide areage estimates for jurisdictional wetland in the review area: Acres: _______

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
   - Provide areage estimates for jurisdictional wetland in the review area: Acres: _______

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
201

Feature ID: APPROVED JURISDICTIONAL DETERMINATION FORM
U.S Army Cops of Engineers

[ ] Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

[ ] Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):

[ ] Other Non-wetland Waters MBR acres:

[ ] Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

[ ] Non-wetland waters Acres:

[ ] Other waters Acres:

[ ] Wetlands Acres:

Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:  
☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all that apply):

☐ TNWs (new)
☐ Wetlands adjacent to TNWs
☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
☐ Non-RPWs that flow directly or indirectly into TNWs
☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
☐ Impoundments of jurisdictional waters
☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

Non-Wetlands waters Linear Feet Width (ft) and/or Acres

Wetlands Acres:

c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: __________________________  □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a TNW, it is an additional wetland to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
       Watershed Size (sq mi): 49650
       Drainage Area (sq mi): 0.23554
       Average Annual Rainfall (in): 10
       Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

       (a) Relationship with TNW
           □ Tributary flows directly to TNW
           ✔ Tributary flows through _______ tributaries before entering TNW

           Project waters are _______ (or more) river miles from TNW
**U.S. Army Corps of Engineers**

**Project waters are**
- 30 (or more) aerial (straight) miles from tributary to TNW:
- River Miles from tributary to RPW:
- Aerial (straight) miles from tributary to RPW:
- Project waters cross or serve as state boundaries. **Explain:**

**Identify flow route to TNW**
- Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

### (b) General Tributary Characteristics

<table>

☐ Other environmentally-sensitive species Explain:

☐ Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs Linear Feet: __________ Width (ft): __________ TNW Acres __________
   - Wetlands adjacent to TNWs: Acres: __________

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: __________
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: __________
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: __________ Width (ft): __________
       - Other non-wetland waters: Acres: __________

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet): __________ Width (feet): __________ Acres: __________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C..

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters linear feet (ft), width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 203
State: AZ  County/Parish/borough: Pinal County  City: N/A
Center coordinates of site: Lat. 32.8482°N  Long. -111.2599°W
Name of nearest waterbody:
Gila River between Powers Butte and Gillespie Dam
Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:
Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)
☐ Office (Desk) Determination. Date: 
☒ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION
There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.
☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION
There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters [_________] Linear Feet [_________] Width (ft) and/or [_________] Acres
      Wetlands Acres: [_________]

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
☒ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

   Identify TNW: ___________________________ ☐ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): ___________________________ 49650
   Drainage Area (sq mi): ___________________________ 0.00834
   Average Annual Rainfall (in): ___________________________ 10
   Average Annual Snowfall (in): ___________________________ 0

   (ii) Physical Characteristics:

      (a) Relationship with TNW

         ☐ Tributary flows directly to TNW
         ☑ Tributary flows through 4 tributaries before entering TNW

         Project waters are 30 (or more) river miles from TNW
Feature ID: 203

U.S Army Corps of Engineers

Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
Average Width (ft):
Average Depth (ft):
Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Cobble
- Gravel
- Substrate - Vegetation
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:
Subsurface Flow: No Explain:

Dye (or other) test performed:

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community
  - Other (list):

Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: blank
- Mean High water Mark indicated by: blank
- Oil or scum line along shore objects: blank
- Fine shell or debris deposits (foreshore): blank
- Physical markings/characteristics: blank
- Tidal gauges: blank
- Other: blank

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: blank

Identify Specific Pollutants, if known: blank

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: blank
- Wetland Fringe Characteristics: blank

Habitat for:

- Federally Listed Species Explain findings: blank
- Fish/Spawn Areas Explain findings: blank
- Other environmentally-sensitive species Explain findings: blank
- Aquatic/Wildlife diversity Explain:

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac): blank
- Wetland Type, Explain: blank
- Wetland Quality, Explain: blank

Project Wetlands Cross or Serve as State Boundaries, Explain: blank

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: blank

Surface Flow is: blank

Characteristics: blank

Subsurface Flow: Explain Findings: blank

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW

- Discrete wetland hydrologic connection Explain: blank
- Ecological connection Explain: blank
- Separated by berm/barrier Explain: blank

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: blank

Project Wetlands: Aerial Miles from TNW: blank

Flow is From: blank

Estimate approximate Location of Wetland within Floodplain: blank
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain:

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer  Characteristics (type, average width):
- Vegetation  type/percent cover. Explain:
- Habitat for:
  - Federally Listed Species  Explain:
  - Fish/Spawn Areas  Explain:
  - Other environmentally-sensitive species  Explain:
  - Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands.  Check all that apply and provide size estimates in review area:
   - [ ] TNWs  Linear Feet:  Width (ft):  TNW Acres
   - [ ] Wetlands adjacent to TNWs:  Acres:

2. RPWs that flow directly or indirectly into TNWs
   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - [ ] Tributary waters  Linear Feet:  Width (ft).
       - [ ] Other non-wetland waters:  Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet):  Width (feet):  Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
       - Provide acreage estimates for jurisdictional wetland in the review area:  Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area:  Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters Acres:
- Other waters Acres:
- Wetlands Acres:

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

- Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.
- Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant
  - Office Concur with data sheets/delineation report
  - Office Does Not Concur with data sheets/delineation report
- Data Sheets Prepared by the Corps
- Corps Navigable Water Study
- US Geological Survey Hydrologic Atlas
  - USGS NHD Data
  - USGS 8 and 12 digit HUC Maps
- US Geological Survey Map(s) Scale and Quad Name:
  - Cactus Forest, Eloy North, Picacho Pass, Picacho Reservoir, Picacho Reservoir SE, Red Rock, and Valley Farms 7.5-Minute Quadrangles

☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)  
      ☐ Wetlands adjacent to TNWs  
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
      ☐ Non-RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
      ☐ Impoundments of jurisdictional waters  
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres  
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   
   Identify TNW:  
   
   Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   
   (i) General Area Conditions:
   
   | Watershed Size (sq mi): | 49650 |
   | Drainage Area (sq mi):  | 0.00423 |
   | Average Annual Rainfall (in): | 10 |
   | Average Annual Snowfall (in): | 0 |

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   ☑ Tributary flows directly to TNW
   
   ☐ Tributary flows through 4 tributaries before entering TNW

   Project waters are 30 (or more) river miles from TNW

3. Characteristics of all wetlands adjacent to the tributary (if any)
   All wetland(s) being considered in cumulative analysis:
   Wetland acres in total being considered in cumulative analysis:
   Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION
A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.
   Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:
   This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

<table>

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
  - Provide estimates for jurisdictional waters in the review area (check all that apply):
    - Tributary waters Linear Feet: Width (Ft): Acres: |
    - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
  - Provide estimates of jurisdictional waters within the review area (check all that apply):
    - Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
    - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:  

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): _______  Acres: _______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: _______  width (ft): _______
☐ Other Non-wetland Waters MBR acres: _______
☐ Wetlands MBR acres: _______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 400.43 linear feet (ft), 4.95 width (ft)  
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

Additional Comments to Support JD:
Approved Jurisdictional Determination Form

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 205  
State: AZ  
County/Parish/borough: Pinal County  
City: N/A  

Center coordinates of site: Lat. 32.8482°N, Long. -111.2599°W

Name of nearest waterbody:

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:

Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request  
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)  
☐ Office (Desk) Determination. Date:  
☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "Navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)  
      ☐ Wetlands adjacent to TNWs  
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
      ☐ Non-RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
      ☐ Impoundments of jurisdictional waters  
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands
   
   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters  Linear Feet Width (ft) and/or Acres  
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: 
   Check box for vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a TNW that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.00447
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         [ ] Tributary flows directly to TNW
         [✓] Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
## (b) General Tributary Characteristics

<table>
<thead>

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: [ ]

Identify Specific Pollutants, if known: [ ]

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: [ ]
- Wetland Fringe Characteristics: [ ]

Habitat for:

- Federally Listed Species Explain findings: [ ]
- Fish/Spawn Areas Explain findings: [ ]
- Other environmentally sensitive species Explain findings: [ ]
- Aquatic/Wildlife diversity Explain: [ ]

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac): [ ]
- Wetland Type, Explain: [ ]
- Wetland Quality, Explain: [ ]

Project Wetlands Cross or Serve as State Boundaries, Explain: [ ]

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: [ ]

Surface Flow is: [ ]

Characteristics: [ ]

Subsurface Flow: [ ]

Explain Findings: [ ]

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW [ ]
- Wetland Not Directly Abutting Non-TNW [ ]
  - Discrete wetland hydrologic connection Explain: [ ]
  - Ecological connection Explain: [ ]
  - Separated by berm/barrier Explain: [ ]

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: [ ]

Project Wetlands: Aerial Miles from TNW: [ ]

Flow is From: [ ]

Estimate approximate Location of Wetland within Floodplain: [ ]
(ii) Chemical Characteristics:
Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).
Explain
Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer
- Characteristics (type, average width):
- Vegetation type/percent cover. Explain:
- Habitat for:
  - Federally Listed Species
  - Explain:
  - Fish/Spawn Areas
  - Explain:
  - Other environmentally-sensitive species
  - Explain:
  - Aquatic/Wildlife Diversity
  - Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

- All wetland(s) being considered in cumulative analysis:
- Wetland acres in total being considered in cumulative analysis:
- Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

### D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. **TNWs and Adjacent Wetlands.**  Check all that apply and provide size estimates in review area:

   - [ ] TNWs  Linear Feet: [ ] Width (ft): [ ] TNW Acres [ ]
   - [ ] Wetlands adjacent to TNWs:  Acres: [ ]

2. **RPWs that flow directly or indirectly into TNWs**
   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: [ ]
   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: [ ]
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - [ ] Tributary waters  Linear Feet: [ ] Width (Ft): [ ]
       - [ ] Other non-wetland waters:  Acres: [ ]

3. **Non-RPWs that flow directly or indirectly into TNWs.**
   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet): [ ] Width (feet): [ ] Acres: [ ]

4. **Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.**
   - [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: [ ]
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: [ ]
     - Provide acreage estimates for jurisdictional wetland in the review area:  Acres: [ ]

5. **Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW**
   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area:  Acres: [ ]

6. **Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.**
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres): 

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet : width (ft):
☐ Other Non-wetland Waters MBR acres:
☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters 814.08 linear feet (ft), 4.57 width (ft)
☐ Other waters
☐ Wetlands

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There ☑ No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There ☑ No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):

☐ TNWs (new)

☐ Wetlands adjacent to TNWs

☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs

☐ Non-RPWs that flow directly or indirectly into TNWs

☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs

☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs

☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs

☐ Impoundments of jurisdictional waters

☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

Non-Wetlands waters [ ] Linear Feet [ ] Width (ft) and/or [ ] Acres

Wetlands Acres:

 cables

10. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________________  ☐ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.81863
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
      (a) Relationship with TNW
         ☐ Tributary flows directly to TNW
         ☑ Tributary flows through _______ tributaries before entering TNW
         Project waters are _______ river miles from TNW.
Feature ID: APPROVED JURISDICTIONAL DETERMINATION FORM
U.S Army Corps of Engineers

Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics
Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
Average Width (ft):
Average Depth (ft):
Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Gravel

**d) Proximity (Relationship) to TNW**

Project Wetlands: River Miles from TNW: ________________________________

Project Wetlands: Aerial Miles from TNW: ________________________________

Flow is From: ________________________________

Estimate approximate Location of Wetland within Floodplain: ________________________________
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics; ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer  Characteristics (type, average width):
- Vegetation type/percent cover. Explain:
- Habitat for:
  - Federally Listed Species  Explain:
  - Fish/Spawn Areas  Explain:
  - Other environmentally-sensitive species  Explain:
  - Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURIS DICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

   - [ ] TNWs Linear Feet: ______ Width (ft): ______ TNW Acres ______
   - [ ] Wetlands adjacent to TNWs: Acres: ______

2. RPWs that flow directly or indirectly into TNWs

   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: ______
   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: ______

      Provide estimates for jurisdictional waters in the review area (check all that apply):

      - [ ] Tributary waters Linear Feet: ______ Width (ft): ______
      - [ ] Other non-wetland waters: Acres: ______

3. Non-RPWs that flow directly or indirectly into TNWs.

   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.

      Provide estimates of jurisdictional waters within the review area (check all that apply):

      Length (Linear Feet): ______ Width (feet): ______ Acres: ______

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

   - [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

      - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: ______

      - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: ______

      Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

      Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- [ ] Non wetland-Waters (i.e., rivers, streams): Length (linear feet): Width (ft):
- [ ] Other Non-wetland Waters MBR: Acres:
- [ ] Wetlands MBR: Acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- [ ] Non-wetland waters: 834.47 linear feet (ft), 16.76 width (ft)
- [ ] Other waters: Acres
- [ ] Wetlands: Acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

- [ ] Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.
- [ ] Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant
  - Office Concurs with data sheets/delineation report
  - Office Does Not Concur with data sheets/delineation report
- [ ] Data Sheets Prepared by the Corps
- [ ] Corps Navigable Water Study
- [ ] US Geological Survey Hydrologic Atlas
  - USGS NHD Data
  - USGS 8 and 12 digit HUC Maps
- [ ] US Geological Survey Map(s) Scale and Quad Name:
  Cactus Forest, Eloy North, Picacho Pass, Picacho Reservoir, Picacho Reservoir SE, Red Rock, and Valley Farms 7.5-Minute Quadrangles

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  

July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  

Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 207

State: AZ  
County/Parish/borough: Pinal County  
City: N/A

Center coordinates of site: Lat. 32.8482°N  
Long. -111.2599°W

Name of nearest waterbody: 

Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: 

Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request

☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date: 

☐ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):

☐ TNWs (new)

☐ Wetlands adjacent to TNWs

☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs

☐ Non-RPWs that flow directly or indirectly into TNWs

☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs

☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs

☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs

☐ Impoundments of jurisdictional waters

☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

Non-Wetlands waters Linear Feet Width (ft) and/or Acres

Wetlands Acres

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**

   Identify TNW: ___________  □ Vegetation

   Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) **General Area Conditions:**

   | Watershed Size (sq mi): | 49650 |
   | Drainage Area (sq mi):  | 0.00391 |
   | Average Annual Rainfall (in): | 10 |
   | Average Annual Snowfall (in): | 0 |

   (ii) **Physical Characteristics:**

   (a) **Relationship with TNW**

   □ Tributary flows directly to TNW
   ✔ Tributary flows through 4 tributaries before entering TNW
   
   Project waters are 30 (or more) river miles from TNW
Feature ID: 207

U.S Army Corps of Engineers

Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

**D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)**

1. **TNWs and Adjacent Wetlands.** Check all that apply and provide size estimates in review area:

   - TNWs Linear Feet:  
     - Width (ft):  
     - TNW Acres:  
   - Wetlands adjacent to TNWs: Acres:  

2. **RPWs that flow directly or indirectly into TNWs**
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:  
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:  
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet:  
         - Width (Ft):  
       - Other non-wetland waters: Acres:  

3. **Non-RPWs that flow directly or indirectly into TNWs.**
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c. Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet):  
     - Width (feet):  
     - Acres:  

4. **Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.**
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:  
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:  
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:  

5. **Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW**
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C. Provide acreage estimates for jurisdictional wetland in the review area: Acres:  

6. **Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.**
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres): 

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section III.C.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
☐ Other Non-wetland Waters MBR acres:
☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters linear feet (ft), width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 208

State: AZ  
County/Parish/borough: Pinal County  
City: N/A

Center coordinates of site: Lat. 32.8482°N  
Long. -111.2599°W

Name of nearest waterbody:

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:
Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date: 
☐ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☐ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

   Identify TNW: ____________________________  □ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

      Watershed Size (sq mi): _______________ 49650
      Drainage Area (sq mi): _______________ 0.00286
      Average Annual Rainfall (in): __________ 10
      Average Annual Snowfall (in): __________ 0

   (ii) Physical Characteristics:

      (a) Relationship with TNW

         □ Tributary flows directly to TNW
         ☑ Tributary flows through ______ 4 tributaries before entering TNW

         Project waters are _______ 30 (or more) river miles from TNW
**Feature ID:** APPROVED JURISDICTIONAL DETERMINATION FORM

**U.S Army Corps of Engineers**

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis: 

Wetland acres in total being considered in cumulative analysis: 

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands.  Check all that apply and provide size estimates in review area:
   - TNWs  Linear Feet:    Width (ft):     TNW Acres
   - Wetlands adjacent to TNWs:  Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters  Linear Feet:  Width (Ft).
       - Other non-wetland waters:  Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet):  Width (feet):  Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW
       - Provide acreage estimates for jurisdictional wetland in the review area:  Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area:  Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): _______ Acres: _______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section III.C.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: _______ width (ft): _______

☐ Other Non-wetland Waters MBR acres: _______

☐ Wetlands MBR acres: _______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 164.91 linear feet (ft), 3.30 width (ft)

☐ Other waters acres

☐ Wetlands acres

SECTION IV: DATA SOURCES

## SECTION II: SUMMARY OF FINDINGS

### A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There **Are No** "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

### B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There **Are No** "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☐ TNWs (new)

      ☐ Wetlands adjacent to TNWs

      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs

      ☐ Non-RPWs that flow directly or indirectly into TNWs

      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs

      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs

      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs

      ☐ Impoundments of jurisdictional waters

      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters _______ Linear Feet _______ Width (ft) and/or _______ Acres

      Wetlands Acres: _______

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

   Identify TNW: ____________________________  □ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a

Traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

      Watershed Size (sq mi):  49650
      Drainage Area (sq mi):  0.04612
      Average Annual Rainfall (in):  10
      Average Annual Snowfall (in):  0

   (ii) Physical Characteristics:

      (a) Relationship with TNW

         □ Tributary flows directly to TNW
         ✔ Tributary flows through 4 tributaries before entering TNW

         Project waters are 30 (or more) river miles from TNW

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

### D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. **TNWs and Adjacent Wetlands.** Check all that apply and provide size estimates in review area:
   - [ ] TNWs Linear Feet: ______ Width (ft): ______ TNW Acres: ______
   - [ ] Wetlands adjacent to TNWs: Acres: ______

2. **RPWs that flow directly or indirectly into TNWs**
   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: ______
   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: ______
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - [ ] Tributary waters Linear Feet: ______ Width (Ft): ______ Acres: ______
       - [ ] Other non-wetland waters: Acres: ______

3. **Non-RPWs that flow directly or indirectly into TNWs.**
   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet): ______ Width (feet): ______ Acres: ______

4. **Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.**
   - [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: ______
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: ______
       - Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

5. **Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW**
   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

6. **Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.**
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: 

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres: 

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non-wetland-Waters (i.e., rivers, streams): linear feet : width (ft): 
☐ Other Non-wetland Waters MBR acres: 
☐ Wetlands MBR acres: 

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters linear feet (ft), width (ft) 
☐ Other waters acres 
☐ Wetlands acres 

SECTION IV: DATA SOURCES

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION
A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)    July 5, 2013
B. DISTRICT OFFICE, FILE NAME, AND NUMBER  Los Angeles District, File No. Pending
C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 21
   State: AZ  County/Parish/borough: Pinal County  City: N/A
   Center coordinates of site: Lat. 32.8482°N  Long. -111.2599°W
   Name of nearest waterbody:
   Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:
      Gila River between Powers Butte and Gillespie Dam
   Name of watershed or Hydrologic Unit Code (HUC): 15050100
   ☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
   ☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)
   ☐ Office (Desk) Determination. Date:
   ✑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS
A. RHA SECTION 10 DETERMINATION OF JURISDICATION
   There are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.
   ☐ Waters subject to the ebb and flow of the tide.
   ☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICATION
   There are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.
   1. Waters of the U.S.
      a. Indicate presence of water of U.S. in review area (Check all the apply):
         ☐ TNWs (new)
         ☐ Wetlands adjacent to TNWs
         ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
         ☐ Non-RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
         ☐ Impoundments of jurisdictional waters
         ☐ Isolated (interstate or intrastate) waters, including isolated wetlands
      b. Identify (estimate) size of waters of the U.S. in the review area
         Non-Wetlands waters Linear Feet Width (ft) and/or Acres
         Wetlands Acres:
      c. Limits (boundaries) of Jurisdiction based on:

   2. Non-Regulated Waters/Wetlands (check if applicable):
      ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW: ____________________________ ☐ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.01843
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   ☐ Tributary flows directly to TNW
   ☑ Tributary flows through 4 tributaries before entering TNW

   Project waters are 30 (or more) river miles from TNW
**APPROVED JURISDICTIONAL DETERMINATION FORM**  
**U.S Army Corps of Engineers**

Project waters are river Miles from tributary to RPW:  
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:  
Project waters are aerial (straight) miles from tributary to RPW:  
Project waters cross or serve as state boundaries.  
Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- TNWs  Linear Feet: _______  Width (ft): _______  TNW Acres _______
- Wetlands adjacent to TNWs:  Acres: _______

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: _______
- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: _______
  Provide estimates for jurisdictional waters in the review area (check all that apply):
  - Tributary waters  Linear Feet: _______  Width (Ft): _______
  - Other non-wetland waters:  Acres: _______

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
  Provide estimates of jurisdictional waters within the review area (check all that apply):
  Length (Linear Feet): _______  Width (feet): _______  Acres: _______

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: _______
  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: _______
  Provide acreage estimates for jurisdictional wetland in the review area:  Acres: _______

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
  Provide acreage estimates for jurisdictional wetland in the review area:  Acres: _______

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): ________  Acres: ________

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: ________ width (ft): ________
☐ Other Non-wetland Waters MBR acres: ________
☐ Wetlands MBR acres: ________

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☒ Non-wetland waters 1355.31 linear feet (ft), 9.50 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

**Additional Comments to Support JD:**
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:  
Drainage Feature 210

State: AZ  
County/Parish/borough: Pinal County  
City: N/A

Center coordinates of site:  
Lat. 32.8482°N  
Long. -111.2599°W

Name of nearest waterbody:  
Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  
Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request

☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date: 
☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres: 

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________________ □ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.78566
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
   (a) Relationship with TNW
       □ Tributary flows directly to TNW
       ✓ Tributary flows through 4 tributaries before entering TNW
       Project waters are 30 (or more) river miles from TNW
**APPROVED JURISDICTIONAL DETERMINATION FORM**

Estimate approximate location of wetland within floodplain:
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics; ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

☐ Riparian Buffer Characteristics (type, average width):

☐ Vegetation type/percent cover. Explain:

Habitat for:

☐ Federally Listed Species Explain:

☐ Fish/Spawn Areas Explain:

☐ Other environmentally-sensitive species Explain:

☐ Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?

• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?

• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- [ ] TNWs  Linear Feet: [ ] Width (ft): [ ] TNW Acres [ ]
- [ ] Wetlands adjacent to TNWs: Acres: [ ]

2. RPWs that flow directly or indirectly into TNWs

- [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: [ ]
- [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: [ ]

   Provide estimates for jurisdictional waters in the review area (check all that apply):

   - [ ] Tributary waters  Linear Feet: [ ] Width (Ft): [ ]
   - [ ] Other non-wetland waters: Acres: [ ]

3. Non-RPWs that flow directly or indirectly into TNWs.

- [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

   Provide estimates of jurisdictional waters within the review area (check all that apply):

   Length (Linear Feet): [ ] Width (feet): [ ] Acres: [ ]

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

   - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: [ ]

   - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: [ ]

   Provide acreage estimates for jurisdictional wetland in the review area: Acres: [ ]

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

   Provide acreage estimates for jurisdictional wetland in the review area: Acres: [ ]

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.

Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters
- Other waters
- Wetlands

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________________  □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.02293
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
      (a) Relationship with TNW
         □ Tributary flows directly to TNW
         □ Tributary flows through 4 tributaries before entering TNW
         □ Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW: 
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: 
Project waters are aerial (straight) miles from tributary to RPW: 
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs Linear Feet: Width (ft): TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: Width (Ft).
       - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
   - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters 1333.95 linear feet (ft), 5.68 width (ft)
- Other waters acres
- Wetlands acres

SECTIONS IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☐ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

  1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):

☐ TNWs (new)

☐ Wetlands adjacent to TNWs

☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs

☐ Non-RPWs that flow directly or indirectly into TNWs

☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs

☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs

☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs

☐ Impoundments of jurisdictional waters

☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

Wetlands Acres:

c. Limits (boundaries) of Jurisdiction based on:

  2. Non-Regulated Waters/Wetlands (check if applicable):

☐ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ________________ □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland, that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.00331
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
      (a) Relationship with TNW
         □ Tributary flows directly to TNW
         □ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters cross or serve as state boundaries. Explain:
Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?

• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?

• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

☐ TNWs  Linear Feet:  Width (ft):  TNW Acres
☐ Wetlands adjacent to TNWs:  Acres:

2. RPWs that flow directly or indirectly into TNWs

☐ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

☐ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

Provide estimates for jurisdictional waters in the review area (check all that apply):

☐ Tributary waters  Linear Feet:  Width (ft).
☐ Other non-wetland waters:  Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

☐ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.

Provide estimates of jurisdictional waters within the review area (check all that apply):

Length (Linear Feet):  Width (feet):  Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

☐ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

☐ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

☐ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW

Provide acreage estimates for jurisdictional wetland in the review area:  Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

☐ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetland in the review area:  Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): ______ Acres: ______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: ______ width (ft): ______
☐ Other Non-wetland Waters MBR acres: ______
☐ Wetlands MBR acres: ______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 260.14 linear feet (ft), 4.20 width (ft)
☐ Other waters ______ acres
☐ Wetlands ______ acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☐ Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.
☐ Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant
  ☐ Office Concurs with data sheets/delineation report
  ☐ Office Does Not Concur with data sheets/delineation report
☐ Data Sheets Prepared by the Corps
☐ Corps Navigable Water Study
☐ US Geological Survey Hydrologic Atlas
  ☐ USGS NHD Data
  ☐ USGS 8 and 12 digit HUC Maps
☐ US Geological Survey Map(s) Scale and Quad Name:
  Cactus Forest, Eloy North, Picacho Pass, Picacho Reservoir, Picacho Reservoir SE, Red Rock, and Valley Farms 7.5-Minute Quadrangles

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

**SECTION I: BACKGROUND INFORMATION**

**A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)**

July 5, 2013

**B. DISTRICT OFFICE, FILE NAME, AND NUMBER**

Los Angeles District, File No. Pending

**C. PROJECT LOCATION AND BACKGROUND INFORMATION:** Drainage Feature 213

- **State:** AZ
- **County/Parish/borough:** Pinal County
- **City:** N/A
- **Name of nearest waterbody:** Gila River between Powers Butte and Gillespie Dam
- **Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:** Gila River between Powers Butte and Gillespie Dam
- **Name of watershed or Hydrologic Unit Code (HUC):** 15050100

- **Center coordinates of site:**
  - Lat.: 32.8482°N
  - Long.: -111.2599°W

**D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)**

- Office (Desk) Determination.
- Field Determination. Date: 10/2012

**SECTION II: SUMMARY OF FINDINGS**

**A. RHA SECTION 10 DETERMINATION OF JURISDICTION**

There **Are No** "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

- Waters subject to the ebb and flow of the tide.
- Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

**B. CWA SECTION 404 DETERMINATION OF JURISDICTION**

There **Are No** "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      - TNWs (new)
      - Wetlands adjacent to TNWs
      - Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      - Non-RPWs that flow directly or indirectly into TNWs
      - Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      - Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      - Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      - Impoundments of jurisdictional waters
      - Isolated (interstate or intrastate) waters, including isolated wetlands
   
   b. Identify (estimate) size of waters of the U.S. in the review area
      - Non-Wetlands waters _________ Linear Feet _________ Width (ft) and/or _________ Acres
      - Wetlands Acres: _________

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

- Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
  - Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ________________  □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.03889
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
      (a) Relationship with TNW
         □ Tributary flows directly to TNW
         ☑ Tributary flows through 4 tributaries before entering TNW
      Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
Average Width (ft):
Average Depth (ft):
Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Gravel
- Substrate - Vegetation
- Bedrock
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.
Presence of Run/Riffle/Pool Complexes. Explain: Not present.
Tributary Geometry: Relatively Straight
Tributary Gradient (approximate average slope): 1%

(c) Flow:
Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5
Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:
Subsurface Flow: No Explain:

Dye (or other) test performed:

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community

Other (list):

Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by:
- Oil or scum line along shore objects
- Fine shell or debris deposits (foreshore)
- Physical markings/characteristics
- Tidal gauges
- Other

- Mean High water Mark indicated by:
- Survey to available datum
- Physical markings
- Vegetation lines/changes in vegetation types

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Identify Specific Pollutants, if known:

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics:
- Wetland Fringe Characteristics:

Habitat for:

- Federally Listed Species Explain findings:
- Fish/Spawn Areas Explain findings:
- Other environmentally-sensitive species Explain findings:
- Aquatic/Wildlife diversity Explain:

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics
Properties:

- Wetland Size (ac):
- Wetland Type, Explain:
- Wetland Quality, Explain:

Project Wetlands Cross or Serve as State Boundaries, Explain:

(b) General Flow Relationship with Non-TNW:

- Wetland Flow is: Explain:
- Surface Flow is:

Characteristics:

- Subsurface Flow: Explain Findings:

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW
  - Discrete wetland hydrologic connection Explain:
  - Ecological connection Explain:
  - Separated by berm/barrier Explain:

(d) Proximity (Relationship) to TNW

- Project Wetlands: River Miles from TNW:
- Project Wetlands: Aerial Miles from TNW:
- Flow is From:

Estimate approximate Location of Wetland within Floodplain:
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: etc.).

Explain:

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer  Characteristics (type, average width):
- Vegetation  type/percent cover. Explain:

Habitat for:

- Federally Listed Species  Explain:
- Fish/Spawn Areas  Explain:
- Other environmentally-sensitive species  Explain:
- Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g., between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to SectionIII.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- TNWs
  - Linear Feet: 
  - Width (ft): 
  - TNW Acres
- Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
  - Provide estimates for jurisdictional waters in the review area (check all that apply):
    - Tributary waters
    - Linear Feet: 
    - Width (ft):
    - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
  - Provide estimates of jurisdictional waters within the review area (check all that apply):
    - Length (Linear Feet): 
    - Width (feet): 
    - Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C..

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): ______ Acres: ______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters ______

Explain finding of no Significant Nexus: See Section III.C.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: ______ width (ft): ______
- Other Non-wetland Waters MBR: acres: ______
- Wetlands MBR: acres: ______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters: 1692.32 linear feet, 5.57 width (ft)
- Other waters: acres
- Wetlands: acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request  
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

**SECTION II: SUMMARY OF FINDINGS**

A. RHA SECTION 10 DETERMINATION OF JURISDICTION  
There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329 in the review area.

☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION  
There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):
   ☐ TNWs (new)  
   ☐ Wetlands adjacent to TNWs  
   ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
   ☐ Non-RPWs that flow directly or indirectly into TNWs  
   ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
   ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
   ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
   ☐ Impoundments of jurisdictional waters  
   ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area  
   Non-Wetlands waters Linear Feet Width (ft) and/or Acres
   Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):  
☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:  

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ___________________________  □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.01502
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
   (a) Relationship with TNW
   □ Tributary flows directly to TNW
   ☑ Tributary flows through 4 tributaries before entering TNW
   Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW: 
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: 
Project waters are aerial (straight) miles from tributary to RPW: 
Project waters cross or serve as state boundaries. Explain: 
Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

### (b) General Tributary Characteristics

Tributary is: Natural Explain: 

Tributary properties with respect to top of bank (estimate):
- Average Width (ft): 
- Average Depth (ft): 
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Cobble
- Gravel
- Substrate - Vegetation

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.]
- Presence of Run/Riffle/Pool Complexes. Explain: Not present.
- Tributary Geometry: Relatively Straight
- Tributary Gradient (approximate average slope): 1%

### (c) Flow

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics: 

Subsurface Flow: No Explain: 

Dye (or other) test performed: 

Tributary Has (Check all that apply):
- Bed and Banks

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands.  Check all that apply and provide size estimates in review area:

   □ TNWs                             Linear Feet: __________  Width (ft): __________  TNW Acres __________
   □ Wetlands adjacent to TNWs:       Acres: __________

2. RPWs that flow directly or indirectly into TNWs

   □ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: __________

   □ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: __________

   Provide estimates for jurisdictional waters in the review area (check all that apply):

   □ Tributary waters  Linear Feet: __________  Width (Ft): __________
   □ Other non-wetland waters:  Acres: __________

3. Non-RPWs that flow directly or indirectly into TNWs.

   □ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

   Provide estimates of jurisdictional waters within the review area (check all that apply):

   Length (Linear Feet): __________  Width (feet): __________  Acres: __________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

   □ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

   □ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: __________

   □ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW

   Provide acreage estimates for jurisdictional wetland in the review area:  Acres: __________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   □ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

   Provide acreage estimates for jurisdictional wetland in the review area:  Acres: __________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C..

Provide estimates for jurisdictional wetland in the review area (in acres): __________

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: __________

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale: __________

Length (linear feet): __________ Acres: __________

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters __________

Explain finding of no Significant Nexus: See Section III.C. __________

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: __________ width (ft): __________
☐ Other Non-wetland Waters MBR acres: __________
☐ Wetlands MBR acres: __________

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 967.53 linear feet (ft), 4.26 width (ft) acres
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

   ☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

   There are no "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329 in 
   the review area.

   ☑ Waters subject to the ebb and flow of the tide.
   ☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

   There are no "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

   1. Waters of the U.S.
      a. Indicate presence of water of U.S. in review area (Check all the apply):
         ☐ TNWs (new)
         ☐ Wetlands adjacent to TNWs
         ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
         ☐ Non-RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
         ☐ Impoundments of jurisdictional waters
         ☐ Isolated (interstate or intrastate) waters, including isolated wetlands
      
      b. Identify (estimate) size of waters of the U.S. in the review area
         Non-Wetlands waters _______ Linear Feet _______ Width (ft) and/or _______ Acres
         Wetlands Acres: _______

   c. Limits (boundaries) of Jurisdiction based on:

   2. Non-Regulated Waters/Wetlands (check if applicable):
      ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered 
      jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a 
      significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

   Identify TNW: ___________________________ ☐ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   | Watershed Size (sq mi): | 49650 |
   | Drainage Area (sq mi): | 4.21754 |
   | Average Annual Rainfall (in): | 10 |
   | Average Annual Snowfall (in): | 0 |

   (ii) Physical Characteristics:

      (a) Relationship with TNW

      ☐ Tributary flows directly to TNW
      ☑ Tributary flows through _______ tributaries before entering TNW

      Project waters are _______ (or more) river miles from TNW
U.S Army Corps of Engineers

**Feature ID:** 215

Project waters are  _river_ Miles from tributary to RPW: 
Project waters are 30 (or more) _aerial (straight)_ miles from tributary to TNW: 
Project waters are _aerial (straight)_ miles from tributary to RPW: 
Project waters cross or serve as state boundaries. Explain: 

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

### D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

#### 1. TNWs and Adjacent Wetlands.
- Check all that apply and provide size estimates in review area:
  - TNWs
  - Wetlands adjacent to TNWs

#### 2. RPWs that flow directly or indirectly into TNWs
- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
  - Provide estimates for jurisdictional waters in the review area (check all that apply):
    - Tributary waters
    - Other non-wetland waters

#### 3. Non-RPWs that flow directly or indirectly into TNWs.
- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
- Provide estimates of jurisdictional waters within the review area (check all that apply):
  - Length (Linear Feet):
  - Width (feet):
  - Acres:

#### 4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
- Provide acreage estimates for jurisdictional wetland in the review area:

#### 5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
- Provide acreage estimates for jurisdictional wetland in the review area:

#### 6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.

☐ Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section III.C.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):

☐ Other Non-wetland Waters MBR acres:

☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters 3846.49 linear feet (ft), 9.56 width (ft)

☐ Other waters acres

☐ Wetlands acres

Additional Comments to Support JD:
SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD) July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 216
   State: AZ  County/Parish/borough: Pinal County  City: N/A
   Center coordinates of site: Lat. 32.8482°N  Long. -111.2599°W
   Name of nearest waterbody:
   Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:
   Gila River between Powers Butte and Gillespie Dam
   Name of watershed or Hydrologic Unit Code (HUC): 15050100
   ☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
   ☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)
   ☐ Office (Desk) Determination. Date: 
   ☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "Navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands
   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:
   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ___________________________ □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.28853
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
         (a) Relationship with TNW
            □ Tributary flows directly to TNW
            ☑ Tributary flows through 4 tributaries before entering TNW
            Project waters are 30 or more river miles from TNW
 APPROVED JURISDICTIONAL DETERMINATION FORM  
U.S Army Corps of Engineers

Feature ID: 216

Project waters are ______________ river Miles from tributary to RPW: 
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: 
Project waters are ______________ aerial (straight) miles from tributary to RPW: 
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Cobbles
- Gravel
- Substrate - Vegetation
- Other, Explain:

Tributary Condition/ Stability [e.g., highly eroding, sloughing banks. Explain]: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:

Subsurface Flow: No Explain:

Dye (or other) test performed:

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Observations of shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community

Other (list):

Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: ____________________________________________________________

- Fine shell or debris deposits (foreshore) ________________________________________________
- Physical markings/characteristics ______________________________________________________
- Tidal gauges ________________________________________________________________________
- Other ______________________________________________________________________________

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: __________________________________________________________________________

Identify Specific Pollutants, if known: _____________________________________________________

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: _____________________________________________________
- Wetland Fringe Characteristics: _______________________________________________________

Habitat for:

- Federally Listed Species Explain findings: ________________________________________________
- Fish/Spawn Areas Explain findings: ______________________________________________________
- Other environmentally-sensitive species Explain findings: __________________________________
- Aquatic/Wildlife diversity Explain: _____________________________________________________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac): _________________________________________________________________
- Wetland Type, Explain: ____________________________________________________________
- Wetland Quality, Explain: __________________________________________________________

Project Wetlands Cross or Serve as State Boundaries, Explain: ______________________________

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: Explain: __________________________________________________________________

Surface Flow is: _________________________________________________________________________

Characteristics: ________________________________________________________________________

Subsurface Flow: Explain Findings: _________________________________________________________

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW

- Discrete wetland hydrologic connection Explain: __________________________________________
- Ecological connection Explain: _________________________________________________________
- Separated by berm/barrier Explain: ______________________________________________________

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: _________________________________________________

Project Wetlands: Aerial Miles from TNW: ________________________________________________

Flow is From: _________________________________________________________________________

Estimate approximate Location of Wetland within Floodplain: ________________________________
(ii) Chemical Characteristics:
Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).
Explain
Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):
- Box Riparian Buffer Characteristics (type, average width):
- Box Vegetation type/percent cover. Explain:
  Habitat for:
  - Box Federally Listed Species Explain:
  - Box Fish/Spawn Areas Explain:
  - Box Other environmentally-sensitive species Explain:
  - Box Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)
All wetland(s) being considered in cumulative analysis:
Wetland acres in total being considered in cumulative analysis:
Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION
A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.
Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g., between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.
Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downdgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs Linear Feet: Width (ft): TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: Width (Ft).
       - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
       - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: 

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): _______  Acres: _______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams):  linear feet : _______ width (ft): _______
☐ Other Non-wetland Waters MBR acres: _______
☐ Wetlands MBR acres: _______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters  987.34 linear feet (ft), 9.77 width (ft)
☐ Other waters  acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

**A. RHA SECTION 10 DETERMINATION OF JURISDICTION**

There **Are No** "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

**B. CWA SECTION 404 DETERMINATION OF JURISDICTION**

There **Are No** "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      - ☐ TNWs (new)
      - ☐ Wetlands adjacent to TNWs
      - ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      - ☐ Non-RPWs that flow directly or indirectly into TNWs
      - ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      - ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      - ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      - ☐ Impoundments of jurisdictional waters
      - ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      - Non-Wetlands waters _______ Linear Feet _______ Width (ft) and/or _______ Acres
      - Wetlands Acres: _______

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   - ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
     Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW: ___________________________ ☐ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

(i) General Area Conditions:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all of its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

   - [ ] TNWs Linear Feet: __________ Width (ft): __________ TNW Acres __________
   - [ ] Wetlands adjacent to TNWs: Acres: __________

2. RPWs that flow directly or indirectly into TNWs

   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: __________
   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: __________

     Provide estimates for jurisdictional waters in the review area (check all that apply):
     - [ ] Tributary waters Linear Feet: __________ Width (Ft).
     - [ ] Other non-wetland waters: Acres: __________

3. Non-RPWs that flow directly or indirectly into TNWs.

   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

     Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet): __________ Width (feet): __________ Acres: __________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

   - [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

     - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: __________

     - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: __________

     Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

     Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: 

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): _______  Acres: _______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non-wetland-Waters (i.e., rivers, streams): linear feet: _______ width (ft): _______
☐ Other Non-wetland Waters MBR acres: _______
☐ Wetlands MBR acres: _______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters _______ 572.21 linear feet (ft), 5.24 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:  
Drainage Feature 218  
State: AZ  
County/Parish/borough: Pinal  
Center coordinates of site: Lat. 32.8482°N  Long. -111.2599°W  
City: N/A

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)  
☐ Office (Desk) Determination. Date:  
☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)  
      ☐ Wetlands adjacent to TNWs  
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
      ☐ Non-RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
      ☐ Impoundments of jurisdictional waters  
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres  
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW: ____________________________ ☐ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.02786
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   ☐ Tributary flows directly to TNW
   ☑ Tributary flows through 4 tributaries before entering TNW

   Project waters are 30 (or more) river miles from TNW
**Feature ID:** 218

**U.S. Army Corps of Engineers**

Project waters are river Miles from tributary to RPW:

Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:

Project waters are aerial (straight) miles from tributary to RPW:

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

### (b) General Tributary Characteristics

Tributary is: Natural  
Explain:

Tributary properties with respect to top of bank (estimate):
- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- [ ] Silts
- [ ] Sands
- [ ] Concrete
- [ ] Muck
- [ ] Cobbles
- [ ] Gravel
- [ ] Substrate - Vegetation
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain:] Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

### (c) Flow

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined  
Characteristics:

Subsurface Flow: No  
Explain:

- Dye (or other) test performed:

Tributary Has (Check all that apply):
- [ ] Bed and Banks
- [ ] OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community
- Other (list):

Discontinuous?  
Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: [ ]
- Mean High water Mark indicated by: [ ]
- Oil or scum line along shore objects [ ]
- Fine shell or debris deposits (foreshore) [ ]
- Physical markings/characteristics [ ]
- Tidal gauges [ ]
- Other [ ]

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: [ ]

Identify Specific Pollutants, if known:

[ ]

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: [ ]
- Wetland Fringe Characteristics: [ ]

Habitat for:

- Federally Listed Species Explain findings: [ ]
- Fish/Spawn Areas Explain findings: [ ]
- Other environmentally sensitive species Explain findings: [ ]
- Aquatic/Wildlife diversity Explain: [ ]

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

Wetland Size (ac): [ ]

Wetland Type, Explain: [ ]

Wetland Quality, Explain: [ ]

Project Wetlands Cross or Serve as State Boundaries, Explain: [ ]

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: [ ]

Surface Flow is: [ ]

Characteristics: [ ]

Subsurface Flow: [ ]

Explain Findings: [ ]

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW [ ]
- Wetland Not Directly Abutting Non-TNW [ ]
- Discrete wetland hydrologic connection Explain: [ ]
- Ecological connection Explain: [ ]
- Separated by berm/barrier Explain: [ ]

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: [ ]

Project Wetlands: Aerial Miles from TNW: [ ]

Flow is From: [ ]

Estimate approximate Location of Wetland within Floodplain: [ ]
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain
Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer Characteristics (type, average width):
- Vegetation type/percent cover. Explain:
  Habitat for:
  - Federally Listed Species Explain:
  - Fish/Spawn Areas Explain:
  - Other environmentally-sensitive species Explain:
  - Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- TNWs
  - Linear Feet: ____________ Width (ft): ____________ TNW Acres ____________
- Wetlands adjacent to TNWs: Acres: ____________

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: ____________
- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: ____________
  - Provide estimates for jurisdictional waters in the review area (check all that apply):
    - Tributary waters: Linear Feet: ____________ Width (Ft): ____________
    - Other non-wetland waters: Acres: ____________

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
  - Provide estimates of jurisdictional waters within the review area (check all that apply):
    - Length (Linear Feet): ____________ Width (feet): ____________ Acres: ____________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: ____________
  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: ____________
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres: ____________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres: ____________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): _______  Acres: _______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: _______ width (ft): _______

☐ Other Non-wetland Waters MBR acres: _______

☐ Wetlands MBR acres: _______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters linear feet (ft), _______ width (ft) 4.42

☐ Other waters acres

☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION
A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:  
Drainage Feature 219

State: AZ  
County/Parish/borough: Pinal County  
City: N/A

Center coordinates of site:  
Lat. 32.8482°N  
Long. -111.2599°W

Name of nearest waterbody:  
Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)
☐ Office (Desk) Determination. Date:  
☒ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS
A. RHA SECTION 10 DETERMINATION OF JURISDICTION
There ☐ Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.
☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION
There ☐ Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☒ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________________ ☐ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.02008
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         ☐ Tributary flows directly to TNW
         ☑ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
Project waters are
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:
Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics
Tributary is: Natural Explain:
Tributary properties with respect to top of bank (estimate):
Average Width (ft): 
Average Depth (ft): 
Average Side Slopes: 3:1
Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Gravel
- Substrate - Vegetation
- Other, Explain: 
Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.
Presence of Run/Riffle/Pool Complexes. Explain: Not present.
Tributary Geometry: Relatively Straight
Tributary Gradient (approximate average slope): 1%

(c) Flow:
Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5
Describe Flow Regime: Ephemeral.
Other Information on Duration and Volume:
Surface Flow is: Discrete and Confined Characteristics: 
Subsurface Flow: No Explain: 
Dye (or other) test performed:
Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community
  - Other (list): 
- Discontinuous? Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)
All wetland(s) being considered in cumulative analysis:
Wetland acres in total being considered in cumulative analysis:
Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION
A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.
Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs: Linear Feet: Width (ft): TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: Width (ft).
       - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.

   Provide estimates of jurisdictional waters within the review area (check all that apply):
   - Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:

   Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

   Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- [ ] Non-wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- [ ] Other Non-wetland Waters MBR acres:
- [ ] Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- [ ] Non-wetland waters linear feet (ft), width (ft)
- [ ] Other waters acres
- [ ] Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☐ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: □ vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.01130
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
   (a) Relationship with TNW
   □ Tributary flows directly to TNW
   ✔ Tributary flows through 4 tributaries before entering TNW
   Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - [ ] TNWs  Linear Feet: ___________ Width (ft): ___________ TNW Acres ___________
   - [ ] Wetlands adjacent to TNWs: Acres: ___________

2. RPWs that flow directly or indirectly into TNWs
   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: ___________
   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: ___________
     Provide estimates for jurisdictional waters in the review area (check all that apply):
     - [ ] Tributary waters  Linear Feet: ___________ Width (Ft): ___________ Acres: ___________
     - [ ] Other non-wetland waters: Acres: ___________

3. Non-RPWs that flow directly or indirectly into TNWs.
   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     Provide estimates of jurisdictional waters within the review area (check all that apply):
     Length (Linear Feet): ___________ Width (feet): ___________ Acres: ___________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: ___________
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: ___________
     Provide acreage estimates for jurisdictional wetland in the review area: Acres: ___________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     Provide acreage estimates for jurisdictional wetland in the review area: Acres: ___________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
22

Feature ID: 22

U.S. Army Corps of Engineers

Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
☐ Other Non-wetland Waters MBR acres:
☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 382.61 linear feet (ft), 7.12 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:  
Drainage Feature 220

State: AZ
County/Parish/borough: Pinal County
City: N/A

Center coordinates of site: Lat. 32.8482°N Long. -111.2599°W
Name of nearest waterbody: 
Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: 
Gila River between Powers Butte and Gillespie Dam
Name of watershed or Hydrologic Unit Code (HUC): 15050100

☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date: 
☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICATION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):
   ☐ TNWs (new)
   ☐ Wetlands adjacent to TNWs
   ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
   ☐ Non-RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
   ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
   ☐ Impoundments of jurisdictional waters
   ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters Linear Feet Width (ft) and/or Acres

      Wetlands Acres: 

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: 
   - ☐ Vegetation

   Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. **Characteristics of non-TNWs that flow directly or indirectly into TNW**

   (i) **General Area Conditions:**
   - Watershed Size (sq mi): 49650
   - Drainage Area (sq mi): 25.63946
   - Average Annual Rainfall (in): 10
   - Average Annual Snowfall (in): 0

   (ii) **Physical Characteristics:**

      (a) **Relationship with TNW**
      - ☐ Tributary flows directly to TNW
      - ✔ Tributary flows through 4 tributaries before entering TNW

      Project waters are 30 (or more) river miles from TNW
**Feature ID:** APPROVED JURISDICTIONAL DETERMINATION FORM

**U.S. Army Corps of Engineers**

Project waters are river Miles from tributary to RPW:

Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:

Project waters are aerial (straight) miles from tributary to RPW:

Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) **General Tributary Characteristics**

Tributary is: Natural

Tributary properties with respect to top of bank (estimate):

- Average Width (ft):
- Average Depth (ft):

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - [ ] TNWs Linear Feet: [ ] Width (ft): [ ] TNW Acres [ ]
   - [ ] Wetlands adjacent to TNWs: Acres: [ ]

2. RPWs that flow directly or indirectly into TNWs
   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: [ ]
   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: [ ]
     Provide estimates for jurisdictional waters in the review area (check all that apply):
     - [ ] Tributary waters Linear Feet: [ ] Width (ft): [ ]
     - [ ] Other non-wetland waters: Acres: [ ]

3. Non-RPWs that flow directly or indirectly into TNWs.
   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     Provide estimates of jurisdictional waters within the review area (check all that apply):
     Length (Linear Feet): [ ] Width (feet): [ ] Acres: [ ]

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: [ ]
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: [ ]
     Provide acreage estimates for jurisdictional wetland in the review area: Acres: [ ]

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     Provide acreage estimates for jurisdictional wetland in the review area: Acres: [ ]

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
☐ Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres): [ ]

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): [ ] Acres: [ ]

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

☒ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There are no "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There are no "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      - Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      - Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:
      2. Non-Regulated Waters/Wetlands (check if applicable):
         ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
         Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

   Identify TNW: ___________________ □ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.06941
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

      (a) Relationship with TNW

         □ Tributary flows directly to TNW
         ✓ Tributary flows through 4 tributaries before entering TNW

      Project waters are 30 (or more) river miles from TNW
(b) General Tributary Characteristics

Tributary is: Natural
Explain:

Tributary properties with respect to top of bank (estimate):
- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Gravel
- Bedrock
- Substrate - Vegetation
- Other, Explain:

Tributary Condition/ Stability [e.g., highly eroding, sloughing banks. Explain: Stable.
Explain:

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5
Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined
Characteristics:

Subsurface Flow: No
Explain:

Dye (or other) test performed:

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community

Other (list):

Discontinuous? Explain:
(iii) Chemical Characteristics:
Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):
Explain:
Identify Specific Pollutants, if known:

(iv) Biological Characteristics. Channel supports (check all that apply):

Explain Findings:

(c) Wetland Adjacency Determination with Non-TNW:
- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW
  - Discrete wetland hydrologic connection Explain:
  - Ecological connection Explain:
  - Separated by berm/barrier Explain:

(d) Proximity (Relationship) to TNW
Project Wetlands: River Miles from TNW:
Flow is From:
Estimate approximate Location of Wetland within Floodplain:
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer Characteristics (type, average width):
- Vegetation type/percent cover. Explain:

Habitat for:
- Federally Listed Species Explain:
- Fish/Spawn Areas Explain:
- Other environmentally-sensitive species Explain:
- Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

<table>

2. RPWs that flow directly or indirectly into TNWs

   □ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: __________

   □ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: __________

   Provide estimates for jurisdictional waters in the review area (check all that apply):

   □ Tributary waters Linear Feet: __________ Width (Ft).__________ Acres: __________

   □ Other non-wetland waters: Acres: __________

3. Non-RPWs that flow directly or indirectly into TNWs.

   □ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

   Provide estimates of jurisdictional waters within the review area (check all that apply):

   Length (Linear Feet): __________ Width (feet): __________ Acres: __________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

   □ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

   □ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: __________

   □ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: __________

   Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   □ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

   Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Feature ID: 221

☑ Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres): 

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: 

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale: 
Length (linear feet): 
Acres: 

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters 

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
☐ Other Non-wetland Waters MBR acres: 
☐ Wetlands MBR acres: 

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters linear feet (ft), width (ft)
☐ Other waters acres 
☐ Wetlands acres 

SECTION IV: DATA SOURCES

   ☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS
A. RHA SECTION 10 DETERMINATION OF JURISDICTION
   There □Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.
   ☑ Waters subject to the ebb and flow of the tide.
   ☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION
   There □Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.
   1. Waters of the U.S.
      a. Indicate presence of water of U.S. in review area (Check all the apply):
         ☑ TNWs (new)
         ☐ Wetlands adjacent to TNWs
         ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
         ☐ Non-RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
         ☐ Impoundments of jurisdictional waters
         ☑ Isolated (interstate or intrastate) waters, including isolated wetlands

      b. Identify (estimate) size of waters of the U.S. in the review area
         Non-Wetlands waters Linear Feet Width (ft) and/or Acres
         Wetlands Acres:

      c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drains is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: [ ] Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
   - Watershed Size (sq mi): 49650
   - Drainage Area (sq mi): 0.04156
   - Average Annual Rainfall (in): 10
   - Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
   (a) Relationship with TNW
   - [ ] Tributary flows directly to TNW
   - [ ] Tributary flows through [ ] tributaries before entering TNW
   - [ ] Project waters are [ ] river miles from TNW
(b) General Tributary Characteristics

Tributary is: Natural
Explain:

Tributary properties with respect to top of bank (estimate):
- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Gravel
- Substrate - Vegetation
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined
Characteristics:

Subsurface Flow: No
Explain:

☐ Dye (or other) test performed:

Tributary Has (Check all that apply):

☐ Bed and Banks
☐ OHWM (check all the apply): OHWM Indicators:
- Clear, natural line impressed on the bank
- Changes in soil character

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

   Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

☐ TNWs Linear Feet: __________ Width (ft): __________ TNW Acres __________

☐ Wetlands adjacent to TNWs: Acres: __________________________

2. RPWs that flow directly or indirectly into TNWs

☐ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

☐ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

Provide estimates for jurisdictional waters in the review area (check all that apply):

☐ Tributary waters Linear Feet: __________ Width (ft): __________ Acres: __________________________

☐ Other non-wetland waters: Acres: __________________________

3. Non-RPWs that flow directly or indirectly into TNWs.

☐ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

Provide estimates of jurisdictional waters within the review area (check all that apply):

Length (Linear Feet): __________ Width (feet): __________ Acres: __________________________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

☐ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

☐ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

☐ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:

Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________________________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

☐ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________________________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet):  
Acres:  

F. NON‐JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non‐Jurisdictional Waters

Provide acreage estimates for non‐jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland‐Waters (i.e., rivers, streams):  
  length :  
  width (ft):  
- Other Non‐wetland Waters MBR acres:  
- Wetlands MBR acres:  

Provide acreage estimates for non‐jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non‐wetland waters  
  linear feet (ft),  
  width (ft)  
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 223  
State: AZ  
County/Parish/borough: Pinal County  
City: N/A  
Center coordinates of site: Lat. 32.8482°N Long. -111.2599°W

Name of nearest waterbody:  
Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  
Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)  
☐ Office (Desk) Determination. Date:
☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION  
There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION  
There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.  
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area  
      Non-Wetlands waters ___________ Linear Feet ___________ Width (ft) and/or ___________ Acres
      Wetlands Acres: ___________

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
      ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ___________________________ □ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

       Watershed Size (sq mi): 49650
       Drainage Area (sq mi): 0.06288
       Average Annual Rainfall (in): 10
       Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

       (a) Relationship with TNW

       ☐ Tributary flows directly to TNW
       ☑ Tributary flows through _______ tributaries before entering TNW

       Project waters are _______ (or more) river miles from TNW

       See Enginee...

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis: [ ] [ ]

Wetland acres in total being considered in cumulative analysis: [ ] [ ]

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

<table>
<thead>
<tr>
<th>□ TNWs</th>
<th>Linear Feet:</th>
<th>Width (ft):</th>
<th>TNW Acres</th>
</tr>
</thead>
<tbody>
<tr>
<td>□ Wetlands adjacent to TNWs:</td>
<td>Acres:</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

2. RPWs that flow directly or indirectly into TNWs

- □ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

- □ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

  Provide estimates for jurisdictional waters in the review area (check all that apply):

  - □ Tributary waters | Linear Feet: | Width (ft): |
  - □ Other non-wetland waters: | Acres: |

3. Non-RPWs that flow directly or indirectly into TNWs.

- □ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

  Provide estimates of jurisdictional waters within the review area (check all that apply):

  - Length (Linear Feet): | Width (feet): | Acres: |

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- □ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

  - □ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

  - □ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:

  Provide acreage estimates for jurisdictional wetland in the review area: | Acres: |

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- □ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

  Provide acreage estimates for jurisdictional wetland in the review area: | Acres: |

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): _______ Acres: _______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- ☐ Non wetland-Waters (i.e., rivers, streams): linear feet: _______ width (ft): _______
- ☐ Other Non-wetland Waters MBR acres: _______
- ☐ Wetlands MBR acres: _______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- ☑ Non-wetland waters linear feet (ft), 1266.85 width (ft), 5.45 acres
- ☐ Other waters acres
- ☐ Wetlands acres

SECTION IV: DATA SOURCES

- Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
- Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

### D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

- Office (Desk) Determination. Date: 
- Field Determination. Date(s): 10/2012

### SECTION II: SUMMARY OF FINDINGS

**A. RHA SECTION 10 DETERMINATION OF JURISDICTION**

- There are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.
- Waters subject to the ebb and flow of the tide.
- Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

**B. CWA SECTION 404 DETERMINATION OF JURISDICTION**

- There are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   - Indicate presence of water of U.S. in review area (Check all the apply):
     - TNWs (new)
     - Wetlands adjacent to TNWs
     - Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
     - Non-RPWs that flow directly or indirectly into TNWs
     - Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
     - Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
     - Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
     - Impoundments of jurisdictional waters
     - Isolated (interstate or intrastate) waters, including isolated wetlands

2. Identify (estimate) size of waters of the U.S. in the review area
   - Non-Wetlands waters Linear Feet Width (ft) and/or Acres
   - Wetlands Acres:

3. Limits (boundaries) of Jurisdiction based on:
   - Non-Regulated Waters/Wetlands (check if applicable):
     - Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
       - Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________________ □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
   - Watershed Size (sq mi): 49650
   - Drainage Area (sq mi): 1.57447
   - Average Annual Rainfall (in): 10
   - Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:

   (a) Relationship with TNW
   - □ Tributary flows directly to TNW
   - ✓ Tributary flows through 4 tributaries before entering TNW
   - Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW: 
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: 
Project waters are aerial (straight) miles from tributary to RPW: 
Project waters cross or serve as state boundaries. Explain: 
Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River. 

(b) General Tributary Characteristics
Tributary is: Natural Explain: 
Tributary properties with respect to top of bank (estimate):
  Average Width (ft): 
  Average Depth (ft): 
  Average Side Slopes: 3:1 
Primary tributary substrate composition (check all that apply):
  Silts
  Sands
  Concrete
  Muck
  Cobble
  Gravel
  Substrate - Vegetation
  Other, Explain: 
Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.
Presence of Run/Riffle/Pool Complexes. Explain: Not present.
Tributary Geometry: Relatively Straight 
Tributary Gradient (approximate average slope): 1%

(c) Flow:
Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5
Describe Flow Regime: Ephemeral.

Characteristics: Subsurface Flow: Explain Findings:

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW
  - Discrete wetland hydrologic connection Explain:
  - Ecological connection Explain:
  - Separated by berm/barrier Explain:

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW:
Project Wetlands: Aerial Miles from TNW:
Flow is From:
Estimate approximate Location of Wetland within Floodplain:
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain: 

Identify specific pollutants, if known:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer Characteristics (type, average width):
- Vegetation type/percent cover. Explain:

Habitat for:

- Federally Listed Species Explain:
- Fish/Spawn Areas Explain:
- Other environmentally-sensitive species Explain:
- Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Giffespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- [ ] TNWs Linear Feet: [ ] Width (ft): [ ] TNW Acres [ ]
- [ ] Wetlands adjacent to TNWs: Acres: [ ]

2. RPWs that flow directly or indirectly into TNWs

- [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: [ ]
- [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: [ ]

  Provide estimates for jurisdictional waters in the review area (check all that apply):

  - [ ] Tributary waters Linear Feet: [ ] Width (ft): [ ]
  - [ ] Other non-wetland waters: Acres: [ ]

3. Non-RPWs that flow directly or indirectly into TNWs.

- [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

  Provide estimates of jurisdictional waters within the review area (check all that apply):

  Length (Linear Feet): [ ] Width (feet): [ ] Acres: [ ]

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

  - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: [ ]

  - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: [ ]

  Provide acreage estimates for jurisdictional wetland in the review area: Acres: [ ]

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

  Provide acreage estimates for jurisdictional wetland in the review area: Acres: [ ]

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
☐ Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
☐ Other Non-wetland Waters MBR acres:
☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters 2450.10 linear feet (ft), 7.02 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☑ Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.

☑ Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant

**SECTION II: SUMMARY OF FINDINGS**

**A. RHA SECTION 10 DETERMINATION OF JURISDICTION**

- There **Are No** "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.
- Waters subject to the ebb and flow of the tide.
- Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

**B. CWA SECTION 404 DETERMINATION OF JURISDICTION**

- There **Are No** "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      - [ ] TNWs (new)
      - [ ] Wetlands adjacent to TNWs
      - [ ] Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      - [ ] Non-RPWs that flow directly or indirectly into TNWs
      - [ ] Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      - [ ] Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      - [ ] Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      - [ ] Impoundments of jurisdictional waters
      - [ ] Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      - Non-Wetlands waters _______ Linear Feet _______ Width (ft) and/or _______ Acres
      - Wetlands Acres: _______ Acres

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   - [ ] Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
     - Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: __________________________
   - Vegetation: ________
   - Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   - Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary, then it is jurisdictional.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) **General Area Conditions:**
   - Watershed Size (sq mi): 49650
   - Drainage Area (sq mi): 0.02324
   - Average Annual Rainfall (in): 10
   - Average Annual Snowfall (in): 0

   (ii) **Physical Characteristics:**
   - **(a) Relationship with TNW**
     - Tributary flows directly to TNW: ________
     - Tributary flows through ________ tributaries before entering TNW
     - Project waters are ________ river miles from TNW

- Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

   Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - [ ] TNWs Linear Feet: __________ Width (ft): __________ TNW Acres __________
   - [ ] Wetlands adjacent to TNWs: Acres: __________

2. RPWs that flow directly or indirectly into TNWs
   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: __________
   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: __________
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - [ ] Tributary waters Linear Feet: __________ Width (Ft): __________
       - [ ] Other non-wetland waters: Acres: __________

3. Non-RPWs that flow directly or indirectly into TNWs.
   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet): __________ Width (feet): __________ Acres: __________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: __________
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW __________
       - Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.

---

The Gila River between Powers Butte and Gillespie Dam.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): _____ Acres: _____

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: _____ width (ft): _____
☐ Other Non-wetland Waters MBR: acres: _____
☐ Wetlands MBR: acres: _____

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters: 606.49 linear feet (ft), 5.27 width (ft)
☐ Other waters: acres
☐ Wetlands: acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

Additional Comments to Support JD:
SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD) July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:

Drainage Feature 226

State: AZ County/Parish/borough: Pinal County City: N/A

Center coordinates of site: Lat. 32.8482°N Long. -111.2599°W

Name of nearest waterbody:

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:

Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request

☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:

☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters __________________ Linear Feet Width (ft) and/or __________ Acres

      Wetlands Acres: ________

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☐ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: □ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary, that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.00249
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   □ Tributary flows directly to TNW
   ✔ Tributary flows through 4 tributaries before entering TNW

   Project waters are 30 (or more) river miles from TNW
**Feature ID:** 226

**U.S Army Corps of Engineers**

<table>
<thead>
<tr>

</thead>
</table>

**Project waters are** river Miles from tributary to RPW: 

**Project waters are** 30 (or more) aerial (straight) miles from tributary to TNW: 

**Project waters are** aerial (straight) miles from tributary to RPW: 

**Project waters cross or serve as state boundaries.** Explain: 

**Identify flow route to TNW** 

Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

### (b) General Tributary Characteristics

- **Tributary is:** Natural 
  - Explain: 

**Tributary properties with respect to top of bank (estimate):** 

- Average Width (ft): 
- Average Depth (ft): 
- Average Side Slopes: 3:1

**Primary tributary substrate composition (check all that apply):**

- [ ] Silts
- [ ] Sands
- [ ] Concrete
- [ ] Muck
- [ ] Cobble
- [ ] Gravel
- [ ] Substrate - Vegetation

- Other, Explain: 

**Tributary Condition/Stability** [e.g., highly eroding, sloughing banks. Explain: Stable.

**Presence of Run/Riffle/Pool Complexes.** Explain: Not present.

**Tributary Geometry:** Relatively Straight 

**Tributary Gradient (approximate average slope):** 1%

### (c) Flow

**Tributary Provides for:** Ephemeral Flow 

**Estimate average number of flow events in review area/year:** 2-5

**Describe Flow Regime:** Ephemeral.

**Other Information on Duration and Volume:**

**Surface Flow is:** Discrete and Confined 

**Subsurface Flow:** No 

- Explain: 

- [ ] Dye (or other) test performed: 

**Tributary Has (Check all that apply):**

- [ ] Bed and Banks

- [ ] OHWM (check all the apply): OHWM Indicators:
  - [ ] Clear, natural line impressed on the bank
  - [ ] Changes in soil character
  - [ ] Shelving
  - [ ] Vegetation matted down, bent or absent
  - [ ] Leaf litter disturbed or washed away
  - [ ] Sediment deposition
  - [ ] Water staining

  - Other (list): 

- [ ] Discontinuous? 
  - Explain: 

**Presence of litter and debris**

- [ ] Destruction of terrestrial vegetation

- [ ] Presence of wrack line

- [ ] Sediment sorting

- [ ] Scour

- [ ] Multiple observed or predicted flow events

- [ ] Abrupt change in plant community
2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics
Properties:
- Wetland Size (ac): 
- Wetland Type, Explain:
- Wetland Quality, Explain:

Project Wetlands Cross or Serve as State Boundaries, Explain:

(b) General Flow Relationship with Non-TNW:
- Wetland Flow is: Explain:
- Surface Flow is: 
- Characteristics:
- Subsurface Flow: Explain Findings:

(c) Wetland Adjacency Determination with Non-TNW:
- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW
- Discrete wetland hydrologic connection Explain:
- Ecological connection Explain:
- Separated by berm/barrier Explain:

(d) Proximity (Relationship) to TNW
- Project Wetlands: River Miles from TNW:
- Project Wetlands: Aerial Miles from TNW:
- Flow is From:
- Estimate approximate Location of Wetland within Floodplain:
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain: 

Identify specific pollutants, if know: 

(iii) Biological Characteristics. Wetland supports (check all that apply):

☐ Riparian Buffer  Characteristics (type, average width): 

☐ Vegetation  type/percent cover. Explain:  

Habitat for:

☐ Federally Listed Species  Explain: 

☐ Fish/Spawn Areas  Explain: 

☐ Other environmentally-sensitive species  Explain: 

☐ Aquatic/Wildlife Diversity  Explain: 

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis: 

Wetland acres in total being considered in cumulative analysis: 

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions): 

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?

• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?

• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs
   - Linear Feet: __________  Width (ft): __________  TNW Acres __________
   - Wetlands adjacent to TNWs: Acres: __________

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: __________
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: __________
   - Provide estimates for jurisdictional waters in the review area (check all that apply):
     - Tributary waters Linear Feet: __________  Width (Ft): __________
     - Other non-wetland waters: Acres: __________

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet): __________  Width (feet): __________  Acres: __________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: __________
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: __________
   - Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
   - Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet):  Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams):  linear feet:  width (ft):
- Other Non-wetland Waters MBR:  acres:
- Wetlands MBR:  acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters:  linear feet (ft),  width (ft)
- Other waters:  acres
- Wetlands:  acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☐ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS
A. RHA SECTION 10 DETERMINATION OF JURISDICTION
There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION
There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands
   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:
   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ___________________________  □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.02233
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

      (a) Relationship with TNW
      □ Tributary flows directly to TNW
      ✔ Tributary flows through _______ tributaries before entering TNW
      Project waters are _______ river miles from TNW
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

<table>
<thead>
<tr>

☐ Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)
All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g., between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

**D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)**

1. **TNWs and Adjacent Wetlands.** Check all that apply and provide size estimates in review area:

   - [ ] TNWs Linear Feet: __________ Width (ft): __________ TNW Acres __________
   - [ ] Wetlands adjacent to TNWs: Acres: __________

2. **RPWs that flow directly or indirectly into TNWs**
   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: __________
   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: __________
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - [ ] Tributary waters Linear Feet: __________ Width (Ft): __________ Acres: __________
       - [ ] Other non-wetland waters: Acres: __________

3. **Non-RPWs that flow directly or indirectly into TNWs.**
   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet): __________ Width (feet): __________ Acres: __________

4. **Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.**
   - [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: __________
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: __________
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

5. **Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW**
   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
   - Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

6. **Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.**
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): _______ Acres: _______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: _______ width (ft): _______
☐ Other Non-wetland Waters MBR acres: _______
☐ Wetlands MBR acres: _______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters acres: 1421.78 linear feet (ft), 4.97 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTIONS IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☐ Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.

      jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a
      significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________________  □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.05064

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - □ TNWs  Linear Feet: ____________________ Width (ft): ____________________ TNW Acres
   - □ Wetlands adjacent to TNWs: Acres: ____________________

2. RPWs that flow directly or indirectly into TNWs
   - □ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and rationale indicating that tributary is perennial: ____________________
   - □ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: ____________________
     Provide estimates for jurisdictional waters in the review area (check all that apply):
     - □ Tributary waters  Linear Feet: ____________________ Width (ft): ____________________
     - □ Other non-wetland waters: Acres: ____________________

3. Non-RPWs that flow directly or indirectly into TNWs.
   - □ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     Provide estimates of jurisdictional waters within the review area (check all that apply):
     Length (Linear Feet): ____________________ Width (ft): ____________________ Acres: ____________________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - □ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - □ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: ____________________
     - □ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: ____________________
     Provide acreage estimates for jurisdictional wetland in the review area: Acres: ____________________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW.
   - □ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     Provide acreage estimates for jurisdictional wetland in the review area: Acres: ____________________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): __________  Acres: __________

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: __________ width (ft): __________
☐ Other Non-wetland Waters MBR acres: __________
☐ Wetlands MBR acres: __________

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 892.73 linear feet (ft), 4.06 width (ft)
☐ Other waters __________ acres
☐ Wetlands __________ acres

SECTION IV: DATA SOURCES

☐ Office (Desk) Determination. Date:    
☒ Field Determination. Date(s): 10/2012

**SECTION II: SUMMARY OF FINDINGS**

**A. RHA SECTION 10 DETERMINATION OF JURISDICTION**

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

**B. CWA SECTION 404 DETERMINATION OF JURISDICTION**

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands
   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:    
   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☒ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ________________
   □ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary, that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.00529
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
      (a) Relationship with TNW
         □ Tributary flows directly to TNW
         ✔ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
**Feature ID:** 229

**U.S. Army Corps of Engineers**

Project waters are **river** Miles from tributary to RPW:

Project waters are 30 (or more) **aerial** (straight) miles from tributary to TNW:

Project waters are **aerial** (straight) miles from tributary to RPW:

Project waters cross or serve as state boundaries. **Explain:**

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

### (b) General Tributary Characteristics

**Tributary is:** Natural **Explain:**

**Tributary properties with respect to top of bank (estimate):**

- **Average Width (ft):**
- **Average Depth (ft):**
- **Average Side Slopes:** 3:1

**Primary tributary substrate composition (check all that apply):**

- Silts
- Sands
- Concrete
- Muck
- Cobble
- Gravel
- Substrate - Vegetation
- Other, **Explain:**

**Tributary Condition/Stability** [e.g., highly eroding, sloughing banks. **Explain:** Stable.

**Presence of Run/Riffle/Pool Complexes. **Explain:** Not present.

**Tributary Geometry:** Relatively Straight

**Tributary Gradient (approximate average slope):** 1%

### (c) Flow:

**Tributary Provides for:** Ephemeral Flow

**Estimate average number of flow events in review area/year:** 2-5

**Describe Flow Regime:** Ephemeral.

**Other Information on Duration and Volume:**

**Surface Flow is:** Discrete and Confined **Characteristics:**

**Subsurface Flow:** No **Explain:**

- Dye (or other) test performed:

**Tributary Has (Check all that apply):**

- Bed and Banks
- **OHWM (check all the apply):** OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community

**Other (list):**

- Discontinuous? **Explain:**
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: __________________________
- Mean High water Mark indicated by: __________________________
- oil or scum line along shore objects
- fine shell or debris deposits (foreshore)
- physical markings/characteristics
- tidal gauges
- other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: ____________________________________________

Identify Specific Pollutants, if known:

______________________________

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: __________________________
- Wetland Fringe Characteristics: __________________________

Habitat for:

- Federally Listed Species Explain findings: __________________________
- Fish/Spawn Areas Explain findings: __________________________
- Other environmentally -sensitive species Explain findings: __________________________
- Aquatic/Wildlife diversity Explain: __________________________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac): __________________________
- Wetland Type, Explain: __________________________
- Wetland Quality, Explain: __________________________

Project Wetlands Cross or Serve as State Boundaries, Explain:

______________________________

(b) General Flow Relationship with Non-TNW:

- Wetland Flow is: __________________________
- Surface Flow is: __________________________

Characteristics:

Subsurface Flow: __________________________

Explain Findings: __________________________

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW
  - Discrete wetland hydrologic connection Explain: __________________________
  - Ecological connection Explain: __________________________
  - Separated by berm/barrier Explain: __________________________

(d) Proximity (Relationship) to TNW

- Project Wetlands: River Miles from TNW: __________________________
- Project Wetlands: Aerial Miles from TNW: __________________________

Flow is From: __________________________

Estimate approximate Location of Wetland within Floodplain: __________________________
(ii) Chemical Characteristics:
Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).
Explain
Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer  Characteristics (type, average width):
- Vegetation  type/percent cover. Explain:
- Habitat for:
  - Federally Listed Species  Explain:
  - Fish/Spawn Areas  Explain:
  - Other environmentally-sensitive species  Explain:
  - Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)
All wetland(s) being considered in cumulative analysis:
Wetland acres in total being considered in cumulative analysis:
Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.
Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D: 

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

☐ TNWs  Linear Feet:  Width (ft):  TNW Acres

☐ Wetlands adjacent to TNWs:  Acres:

2. RPWs that flow directly or indirectly into TNWs

☐ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: 

☐ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

Provide estimates for jurisdictional waters in the review area (check all that apply):

☐ Tributary waters  Linear Feet:  Width (Ft).

☐ Other non-wetland waters:  Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

☐ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

Provide estimates of jurisdictional waters within the review area (check all that apply):

Length (Linear Feet):  Width (feet):  Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

☐ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

☐ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

☐ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:

Provide acreage estimates for jurisdictional wetland in the review area:  Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

☐ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetland in the review area:  Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.
   Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet):   Acres:  

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet:   width (ft):  
☐ Other Non-wetland Waters MBR acres:                
☐ Wetlands MBR acres:   

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters linear feet (ft),   width (ft)  
☐ Other waters acres  
☐ Wetlands acres   

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION
   There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.
   ☐ Waters subject to the ebb and flow of the tide.
   ☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION
   There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.
   1. Waters of the U.S.
      a. Indicate presence of water of U.S. in review area (Check all the apply):
         ☐ TNWs (new)
         ☐ Wetlands adjacent to TNWs
         ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
         ☐ Non-RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
         ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
         ☐ Impoundments of jurisdictional waters
         ☐ Isolated (interstate or intrastate) waters, including isolated wetlands
      b. Identify (estimate) size of waters of the U.S. in the review area
         Non-Wetlands waters Linear Feet Width (ft) and/or Acres
         Wetlands Acres:
      c. Limits (boundaries) of Jurisdiction based on:
   2. Non-Regulated Waters/Wetlands (check if applicable):
      ☐ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: 
   - Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   - Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   - (i) **General Area Conditions:**
     - Watershed Size (sq mi): 49650
     - Drainage Area (sq mi): 0.04021
     - Average Annual Rainfall (in): 10
     - Average Annual Snowfall (in): 0

   - (ii) **Physical Characteristics:**
     - (a) **Relationship with TNW**
       - ☑ Tributary flows through 4 tributaries before entering TNW
       - Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW: 
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: 
Project waters are aerial (straight) miles from tributary to RPW: 
Project waters cross or serve as state boundaries. Explain: 
Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain: 

Tributary properties with respect to top of bank (estimate):

- Average Width (ft): 
- Average Depth (ft): 
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):

- Silts
- Sands
- Concrete
- Muck
- Gravel
- Substrate - Vegetation
- Other, Explain: 

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics: 

Subsurface Flow: No Explain: 

- Dye (or other) test performed: 

Tributary Has (Check all that apply):

- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community
  - Other (list): 

- Discontinuous? Explain: 
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):
- [ ] High tide line indicated by: __________________________  [ ] Mean High water Mark indicated by: __________________________
- [ ] oil or scum line along shore objects  [ ] survey to available datum
- [ ] fine shell or debris deposits (foreshore)  [ ] physical markings
- [ ] tidal gauges  [ ] vegetation lines/changes in vegetation types
- [ ] other

(iii) Chemical Characteristics:
Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: __________________________

Identify Specific Pollutants, if known: __________________________

(iv) Biological Characteristics. Channel supports (check all that apply):

- [ ] Riparian Corridor  Characteristics: __________________________
- [ ] Wetland Fringe  Characteristics: __________________________

Habitat for:
- [ ] Federally Listed Species  Explain findings: __________________________
- [ ] Fish/Spawn Areas  Explain findings: __________________________
- [ ] Other environmentally -sensitive species  Explain findings: __________________________
- [ ] Aquatic/Wildlife diversity  Explain: __________________________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW
(i) Physical Characteristics:
(a) General Wetland Characteristics
Properties:
- Wetland Size (ac): __________________________
- Wetland Type, Explain: __________________________
- Wetland Quality, Explain: __________________________

Project Wetlands Cross or Serve as State Boundaries, Explain: __________________________

(b) General Flow Relationship with Non-TNW:
Wetland Flow is: __________________________  Explain: __________________________
Surface Flow is: __________________________
Characteristics: __________________________
Subsurface Flow: __________________________  Explain Findings: __________________________

(c) Wetland Adjacency Determination with Non-TNW:
- [ ] Wetland Directly Abutting Non-TNW
- [ ] Wetland Not Directly Abutting Non-TNW
  - [ ] Discrete wetland hydrologic connection  Explain: __________________________
  - [ ] Ecological connection  Explain: __________________________
  - [ ] Separated by berm/barrier  Explain: __________________________

(d) Proximity (Relationship) to TNW
Project Wetlands: River Miles from TNW: __________________________
Project Wetlands: Aerial Miles from TNW: __________________________
Flow is From: __________________________
Estimate approximate Location of Wetland within Floodplain: __________________________
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

☐ Riparian Buffer Characteristics (type, average width):

☐ Vegetation type/percent cover. Explain:

Habitat for:

☐ Federally Listed Species Explain:

☐ Fish/Spawn Areas Explain:

☐ Other environmentally-sensitive species Explain:

☐ Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinant of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

* Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
* Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
* Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
* Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs Linear Feet: Width (ft): TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: Width (Ft).
       - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
   - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: 

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet):  Acres: 

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams):  linear feet :  width (ft):  
☐ Other Non-wetland Waters MBR  acres:  
☐ Wetlands MBR  acres:  

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters  linear feet (ft),  width (ft) 
☐ Other waters  acres 
☐ Wetlands  acres 

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☑ Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.
☑ Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

**SECTION I: BACKGROUND INFORMATION**

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 230

| State: | AZ |
| County/Parish/borough: | Pinal County |
| City: | N/A |

Center coordinates of site:  
Lat. 32.8482°N  
Long. -111.2599°W

Name of nearest waterbody:  
Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  
Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC):  
15050100

- [x] Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request

- [ ] Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

**SECTION II: SUMMARY OF FINDINGS**

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There [x] Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

- [ ] Waters subject to the ebb and flow of the tide.
- [ ] Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There [x] Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      - [ ] TNWs (new)
      - [ ] Wetlands adjacent to TNWs
      - [ ] Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      - [ ] Non-RPWs that flow directly or indirectly into TNWs
      - [ ] Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      - [ ] Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      - [ ] Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      - [ ] Impoundments of jurisdictional waters
      - [ ] Isolated ( interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      | Non-Wetlands waters | Linear Feet | Width (ft) and/or | Acres |
      |---------------------|-------------|------------------|-------|

      Wetlands Acres: _______________________

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

   - [x] Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ________________________  ☐ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 1.75071
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   ☑ Tributary flows directly to TNW
   ☐ Tributary flows through ______ tributaries before entering TNW

   Project waters are ______ river miles from TNW

   (b) Flow Characteristics

   Average Flow Rate (cfs): ______
   Base Flow Rate (cfs): ______
   Annual Flow Rate (cfs): ______
   Snowmelt Rate (cfs): ______
   Flood Rate (cfs): ______

   (c) Geologic Features

   Bedrock Material: ______
   Soils: ______
   Groundwater: ______

   (d) Vegetation

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs Linear Feet: Width (ft): TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: Width (ft).
       - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): _______ Acres: _______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: _______ width (ft): _______

☐ Other Non-wetland Waters MBR acres: _______

☐ Wetlands MBR acres: _______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 2766.92 linear feet (ft), 9.67 width (ft) acres: _______

☐ Other waters acres: _______

☐ Wetlands acres: _______

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 231

State: AZ  County/Parish/borough: Pinal City: N/A
Center coordinates of site: Lat. 32.8482°N  Long. -111.2599°W
Name of nearest waterbody:
Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:
Gila River between Powers Butte and Gillespie Dam
Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g, offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:  
☐ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There  Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There  Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):
☐ TNWs (new)
☐ Wetlands adjacent to TNWs
☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
☐ Non-RPWs that flow directly or indirectly into TNWs
☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
☐ Impoundments of jurisdictional waters
☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

Non-Wetlands waters Linear Feet Width (ft) and/or Acres
Wetlands Acres:

c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☐ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1; only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW:   
   □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are "relatively permanent waters" (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.01382
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
      (a) Relationship with TNW
         □ Tributary flows directly to TNW
         ✔ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
(b) General Tributary Characteristics

Tributary is: Natural

Tributary properties with respect to top of bank (estimate):
- Average Width (ft): 
- Average Depth (ft): 
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Cobble
- Gravel
- Substrate - Vegetation

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain]: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined

Subsurface Flow: No

Dye (or other) test performed: 

Tributary Has (Check all that apply):

- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community

Discontinuous? Explain: 

□ Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

### (iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

- Explain:

Identify Specific Pollutants, if known:

- Explain:

### (iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics:
- Wetland Fringe Characteristics:

Habitat for:

- Federally Listed Species Explain findings:
- Fish/Spawn Areas Explain findings:
- Other environmentally-sensitive species Explain findings:
- Aquatic/Wildlife diversity Explain:

### 2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

#### (i) Physical Characteristics:

##### (a) General Wetland Characteristics

Properties:

- Wetland Size (ac):
- Wetland Type, Explain:
- Wetland Quality, Explain:

Project Wetlands Cross or Serve as State Boundaries, Explain:

##### (b) General Flow Relationship with Non-TNW:

- Wetland Flow is: Explain:
- Surface Flow is: Characteristics:
- Subsurface Flow: Explain Findings:

##### (c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW
  - Discrete wetland hydrologic connection Explain:
  - Ecological connection Explain:
  - Separated by berm/barrier Explain:

##### (d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW:
Project Wetlands: Aerial Miles from TNW:
Flow is From:
Estimate approximate Location of Wetland within Floodplain:
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer Characteristics (type, average width):
- Vegetation type/percent cover. Explain:

Habitat for:

- Federally Listed Species Explain:
- Fish/Spawn Areas Explain:
- Other environmentally-sensitive species Explain:
- Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

Non-Wetlands waters ______ Linear Feet ______ Width (ft) and/or ______ Acres  
Wetlands Acres: ______

c. Limits (boundaries) of Jurisdiction based on:  

2. Non-Regulated Waters/Wetlands (check if applicable):  
☒ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:  
Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ________________ □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary, that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.00522
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

      (a) Relationship with TNW
         □ Tributary flows directly to TNW
         □ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW: 
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: 
Project waters are aerial (straight) miles from tributary to RPW: 
Project waters cross or serve as state boundaries. Explain: 
Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

**b) General Tributary Characteristics**

3. Characteristics of all wetlands adjacent to the tributary (if any)
All wetland(s) being considered in cumulative analysis:
Wetland acres in total being considered in cumulative analysis:
Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION
A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.
   Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

   This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

### D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. **TNWs and Adjacent Wetlands.** Check all that apply and provide size estimates in review area:

   - [ ] TNWs  Linear Feet:  
   - [ ] Width (ft):  
   - [ ] TNW Acres  

   - [ ] Wetlands adjacent to TNWs:  Acres:  

2. **RPWs that flow directly or indirectly into TNWs**

   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:  

   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:  
      - Provide estimates for jurisdictional waters in the review area (check all that apply):
        - [ ] Tributary waters  Linear Feet:  
        - [ ] Width (ft):  

   - [ ] Other non-wetland waters:  Acres:  

3. **Non-RPWs that flow directly or indirectly into TNWs.**

   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c. Provide estimates of jurisdictional waters within the review area (check all that apply):

   - [ ] Length (Linear Feet):  
   - [ ] Width (feet):  
   - [ ] Acres:  

4. **Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.**

   - [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

   - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

   - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:

      - Provide acreage estimates for jurisdictional wetland in the review area:  Acres:  

5. **Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW**

   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

      - Provide acreage estimates for jurisdictional wetland in the review area:  Acres:  

6. **Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.**
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

7. Impoundments of jurisdictional waters.

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Provide estimates for jurisdictional wetland in the review area (in acres):

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: ______ width (ft): ______
- Other Non-wetland Waters MBR acres: ______
- Wetlands MBR acres: ______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters 589.16 linear feet, 3.61 width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

- Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.
- Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):
☐ TNWs (new)
☐ Wetlands adjacent to TNWs
☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
☐ Non-RPWs that flow directly or indirectly into TNWs
☐ Wetlands directly abutting RPW that flow directly or indirectly into TNWs
☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
☐ Impoundments of jurisdictional waters
☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in review area

Non-Wetlands waters Linear Feet Width (ft) and/or Acres

Wetlands Acres:

c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
☐ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW:  
   □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary, the tributary is not a TNW, and no significant nexus exists.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.00819
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
      □ Tributary flows directly to TNW
      □ Tributary flows through 4 tributaries before entering TNW
      Project waters are 30 (or more) river miles from TNW
(b) General Tributary Characteristics

Tributary is: Natural

Tributary properties with respect to top of bank (estimate):

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

☐ TNWs Linear Feet: ______ Width (ft): ______ TNW Acres ______

☐ Wetlands adjacent to TNWs: Acres: ______

2. RPWs that flow directly or indirectly into TNWs

☐ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: ______

☐ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: ______

Provide estimates for jurisdictional waters in the review area (check all that apply):

☐ Tributary waters Linear Feet: ______ Width (ft): ______ Acres: ______

☐ Other non-wetland waters: Acres: ______

3. Non-RPWs that flow directly or indirectly into TNWs.

☐ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.

Provide estimates of jurisdictional waters within the review area (check all that apply):

Length (Linear Feet): ______ Width (feet): ______ Acres: ______

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

☐ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

☐ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: ______

☐ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: ______

Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

☐ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): _______ Acres: _______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: _______ width (ft): _______

☐ Other Non-wetland Waters MBR acres: _______

☐ Wetlands MBR acres: _______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters linear feet (ft), 553.40 width (ft) 3.73

☐ Other waters acres

☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 234

State: AZ  
County/Parish/borough: Pinal County  
City: N/A  
Center coordinates of site: Lat. 32.8482°N Long. -111.2599°W

Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  
Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:  
☐ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329 in the review area.

☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)  
      ☐ Wetlands adjacent to TNWs  
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
      ☐ Non-RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
      ☐ Impoundments of jurisdictional waters  
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters _______ Linear Feet _______ Width (ft) and/or _______ Acres  
      Wetlands Acres: _______

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW: ________________________ □ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.19229
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

       (a) Relationship with TNW

       □ Tributary flows directly to TNW
       □ Tributary flows through 4 tributaries before entering TNW
       Project waters are 30 (or more) river miles from TNW

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g., between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs  Linear Feet: Width (ft): TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters  Linear Feet: Width (ft).
       - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW
       - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional wetlands.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section III.C.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR: acres:
- Wetlands MBR: acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters: 1968.46 linear feet (ft), 7.01 width (ft)
- Other waters
- Wetlands

SECTION IV: DATA SOURCES

      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: ____________________
   - □ Vegetation
   - Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   - Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. **Characteristics of non-TNWs that flow directly or indirectly into TNW**
   
   (i) **General Area Conditions:**
   
   - Watershed Size (sq mi): 49650
   - Drainage Area (sq mi): 0.03472
   - Average Annual Rainfall (in): 10
   - Average Annual Snowfall (in): 0

   (ii) **Physical Characteristics:**

   (a) **Relationship with TNW**
   
   □ Tributary flows directly to TNW
   
   ✔ Tributary flows through ___ tributaries before entering TNW

   Project waters are ___ river miles from TNW
Feature ID: 235

U.S. Army Corps of Engineers

Project waters are river Miles from tributary to RPW:
Project waters are (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural  Explain:

Tributary properties with respect to top of bank (estimate):
Average Width (ft):
Average Depth (ft):
Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- [ ] Silts
- [ ] Sands
- [ ] Concrete
- [ ] Muck
- [ ] Cobble
- [ ] Gravel
- [ ] Substrate - Vegetation
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:
Subsurface Flow: No Explain:

Dye (or other) test performed:

Tributary Has (Check all that apply):

  - Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- [ ] TNWs  Linear Feet: [ ] Width (ft): [ ] TNW Acres [ ]
- [ ] Wetlands adjacent to TNWs: Acres: [ ]

2. RPWs that flow directly or indirectly into TNWs

- [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: [ ]
- [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: [ ]
  - Provide estimates for jurisdictional waters in the review area (check all that apply):
    - [ ] Tributary waters  Linear Feet: [ ] Width (Ft): [ ]
    - [ ] Other non-wetland waters: Acres: [ ]

3. Non-RPWS that flow directly or indirectly into TNWs.

- [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.
  - Provide estimates of jurisdictional waters within the review area (check all that apply):
    - Length (Linear Feet): [ ] Width (feet): [ ] Acres: [ ]

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: [ ]
  - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: [ ]
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres: [ ]

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres: [ ]

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
☐ Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C..

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet : width (ft):

☐ Other Non-wetland Waters MBR acres:

☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters linear feet (ft), width (ft)

☐ Other waters acres

☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 236

State: AZ  
County/Parish/borough: Pinal County  
City: N/A

Center coordinates of site: Lat. 32.8482°N  
Long. -111.2599°W

Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date: 

☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There ☐ "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There ☐ "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters [ ] Linear Feet [ ] Width (ft) and/or [ ] Acres
      Wetlands Acres: [ ]

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☒ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ___________________________ ☐ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.01951
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         ☐ Tributary flows directly to TNW
         ☑ Tributary flows through ______ tributaries before entering TNW
         Project waters are ______ (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:
Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics
Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):

☐ Other environmentally-sensitive species  Explain:

☐ Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?

• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?

• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands.  Check all that apply and provide size estimates in review area:
   - TNWs  Linear Feet:  Width (ft):  TNW Acres
   - Wetlands adjacent to TNWs:  Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters  Linear Feet:  Width (Ft).
       - Other non-wetland waters:  Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet):  Width (feet):  Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW
     - Provide acreage estimates for jurisdictional wetland in the review area:  Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area:  Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres): __________

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: __________

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale: __________

Length (linear feet): _______ Acres: _______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters __________

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet : _______ width (ft): _______
- Other Non-wetland Waters MBR acres: _______
- Wetlands MBR acres: _______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters 947.91 linear feet (ft), 4.80 width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

- Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.
- Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant
  - Office Concurs with data sheets/delineation report
  - Office Does Not Concur with data sheets/delineation report
- Data Sheets Prepared by the Corps
- Corps Navigable Water Study

**SECTION II: SUMMARY OF FINDINGS**

**A. RHA SECTION 10 DETERMINATION OF JURISDICTION**

There **Are No** "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

**B. CWA SECTION 404 DETERMINATION OF JURISDICTION**

There **Are No** "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☐ TNWs (new)

      ☐ Wetlands adjacent to TNWs

      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs

      ☐ Non-RPWs that flow directly or indirectly into TNWs

      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs

      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs

      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs

      ☐ Impoundments of jurisdictional waters

      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      | Non-Wetlands waters | Linear Feet | Width (ft) and/or | Acres |
      |---------------------|-------------|-------------------|-------|

      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

   2. Non-Regulated Waters/Wetlands (check if applicable):

      ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1; otherwise, see Section III.B below.

1. TNW

Identify TNW: ____________

☐ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.11830
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   ☐ Tributary flows directly to TNW
   ☑ Tributary flows through 4 tributaries before entering TNW

   Project waters are 30 (or more) river miles from TNW
Feature ID: 237

U.S Army Corps of Engineers

Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
Average Width (ft):
Average Depth (ft):
Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Cobble
- Bedrock
- Sands
- Concrete
- Gravel
- Substrate - Vegetation
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5
Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:
Subsurface Flow: No Explain:

Dye (or other) test performed:

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community
  Other (list):

Discontinuous? Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis: 
Wetland acres in total being considered in cumulative analysis: 

Describe each wetland (directly abuts tributary?, size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW? 
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW? 
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs? 
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs
   - Wetlands adjacent to TNWs
   - Linear Feet: ________ Width (ft): ________ TNW Acres ________
   - Acres: ________

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: ________
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: ________
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: ________ Width (Ft): ________
       - Other non-wetland waters: Acres: ________

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet): ________ Width (feet): ________ Acres: ________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: ________
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: ________
   - Provide acreage estimates for jurisdictional wetland in the review area: Acres: ________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
   - Provide acreage estimates for jurisdictional wetland in the review area: Acres: ________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): [ ] Acres: [ ]

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters [ ]

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- [ ] Non wetland-Waters (i.e., rivers, streams): linear feet: [ ] width (ft): [ ]
- [ ] Other Non-wetland Waters MBR acres: [ ]
- [ ] Wetlands MBR acres: [ ]

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the "Significant Nexus" standard, where such a finding is required for jurisdiction (check all that apply):

- [ ] Non-wetland waters linear feet (ft), 733.63 width (ft), 12.67
- [ ] Other waters acres
- [ ] Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ✔ Potentially jurisdictonal waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW: ________________________ □ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

(i) General Area Conditions:

<table>

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis: 

Wetland acres in total being considered in cumulative analysis: 

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs Linear Feet: Width (ft): TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: Width (Ft).
       - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW
       - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: 

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale: 
Length (linear feet): 
Acres: 

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
☐ Other Non-wetland Waters MBR acres: 
☐ Wetlands MBR acres: 

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters linear feet (ft), width (ft) 
☐ Other waters acres
☐ Wetlands acres

Additional Comments to Support JD:
SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature  239

State: AZ  
County/Parish/borough: Pinal County  
City: N/A

Center coordinates of site: Lat. 32.8482°N  
Long. -111.2599°W

Name of nearest waterbody: 
Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc…) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:  
☐ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There ☐ Are ☑ "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There ☐ Are ☑ "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):

☐ TNWs (new)
☐ Wetlands adjacent to TNWs
☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
☐ Non-RPWs that flow directly or indirectly into TNWs
☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
☐ Impoundments of jurisdictional waters
☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

Non-Wetlands waters ________ Linear Feet ________ Width (ft) and/or ________ Acres

Wetlands Acres: ________

C. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

   Identify TNW: ____________________________ ☐ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   | Watershed Size (sq mi) | 49650 |
   | Drainage Area (sq mi)  | 0.31402 |
   | Average Annual Rainfall (in) | 10 |
   | Average Annual Snowfall (in) | 0 |

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   ☐ Tributary flows directly to TNW
   ☑ Tributary flows through 4 tributaries before entering TNW

   Project waters are 30 (or more) river miles from TNW
### APPROVED JURISDICTIONAL DETERMINATION FORM

**U.S Army Corps of Engineers**

**Feature ID:** 239

Project waters are river Miles from tributary to RPW:

Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:

Project waters are aerial (straight) miles from tributary to RPW:

Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

### (b) General Tributary Characteristics

<table>

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis: 
Wetland acres in total being considered in cumulative analysis: 
Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

   - TNWs
   - Linear Feet: Width (ft): TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs

   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters
       - Linear Feet: Width (Ft).
       - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
   - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): _______ Acres: _______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: _______ width (ft): _______
☐ Other Non-wetland Waters MBR acres: _______
☐ Wetlands MBR acres: _______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 2001.32 linear feet (ft), 10.28 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION
A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 24

State: AZ  
County/Parish/borough: Pinal County  
City: N/A

Center coordinates of site: Lat. 32.8482°N  
Long. -111.2599°W

Name of nearest waterbody: 

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: 
Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)
☐ Office (Desk) Determination. Date:

☐ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS
A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There ☐ Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There ☐ Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters ___________ Linear Feet Width (ft) and/or ___________ Acres
      Wetlands Acres: ___________

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

   Identify TNW: ___________  □ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.03086
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   □ Tributary flows directly to TNW
   □ Tributary flows through [ ] tributaries before entering TNW

   Project waters are [ ] river miles from TNW
24
Feature ID:

APPROVED JURISDICTIONAL DETERMINATION FORM
U.S Army Corps of Engineers

Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW:
Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
Average Width (ft):
Average Depth (ft):
Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):

- Silts
- sands
- Concrete
- Muck
- Cobble
- Gravel
- Substrate - Vegetation
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:
Subsurface Flow: No Explain:

☐ Dye (or other) test performed:

Tributary Has (Check all that apply):

☐ Bed and Banks
☒ OHWM (check all the apply): OHWM Indicators:
☐ Clear, natural line impressed on the bank
☒ Changes in soil character
☒ Shelving
☐ Vegetation matted down, bent or absent
☐ Leaf litter disturbed or washed away
☐ Sediment deposition
☐ Water staining

Other (list):

☐ Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- Discrete wetland hydrologic connection Explain: 
- Ecological connection Explain: 
- Separated by berm/barrier Explain: 

(d) Proximity (Relationship) to TNW:

Project Wetlands: River Miles from TNW: 

Project Wetlands: Aerial Miles from TNW: 

Flow is From: 

Estimate approximate Location of Wetland within Floodplain: 

(ii) Chemical Characteristics:
Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain:

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer Characteristics (type, average width):
- Vegetation type/percent cover. Explain:
- Habitat for:
  - Federally Listed Species Explain:
  - Fish/Spawn Areas Explain:
  - Other environmentally-sensitive species Explain:
  - Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical, and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g., between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs
   - Width (ft):
   - TNW Acres
   - Wetlands adjacent to TNWs
   - Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters
       - Linear Feet:
       - Width (Ft):
       - Other non-wetland waters
       - Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet):
     - Width (feet):
     - Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
       - Provide acreage estimates for jurisdictional wetland in the review area:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
   - Provide acreage estimates for jurisdictional wetland in the review area:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
☐ Other Non-wetland Waters MBR acres:
☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters linear feet (ft), width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☐ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:  

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatice resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

   Identify TNW: [ ]  
   [ ] Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. The aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary adjacent with wetlands complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   | Watershed Size (sq mi): | 49650 |
   | Drainage Area (sq mi):  | 0.01101 |
   | Average Annual Rainfall (in): | 10 |
   | Average Annual Snowfall (in): | 0 |

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   [ ] Tributary flows directly to TNW
   [ ] Tributary flows through 4 tributaries before entering TNW

   Project waters are 30 (or more) river miles from TNW
**Feature ID:** 240

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

   - TNWs
     - Linear Feet: __________ Width (ft): __________ TNW Acres __________
   - Wetlands adjacent to TNWs: Acres: __________

2. RPWs that flow directly or indirectly into TNWs

   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: __________
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: __________
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - Tributary waters: Linear Feet: __________ Width (ft): __________ Acres: __________
       - Other non-wetland waters: Acres: __________

3. Non-RPWs that flow directly or indirectly into TNWs.

   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

     Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet): __________ Width (feet): __________ Acres: __________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: __________
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: __________
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

     Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): length: width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters 565.88 linear feet (ft), 6.14 width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☐ Office (Desk) Determination. Date: 
☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There ☐ Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There ☐ Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☑ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW: ____________________________ □ Vegetation

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.00681
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   □ Tributary flows directly to TNW
   ✓ Tributary flows through 4 tributaries before entering TNW
   Project waters are 30 (or more) river miles from TNW
Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural

Tributary properties with respect to top of bank (estimate):
- Average Width (ft): 
- Average Depth (ft): 
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- [ ] Silts
- [ ] Sands
- [ ] Concrete
- [ ] Muck
- [ ] Cobble
- [ ] Gravel
- [ ] Substrate - Vegetation
- Other, Explain: 

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined

Subsurface Flow: No

[ ] Dye (or other) test performed:

Tributary Has (Check all that apply):

[ ] Bed and Banks
[ ] OHWM (check all the apply): OHWM Indicators:
- [ ] Clear, natural line impressed on the bank
- [ ] Changes in soil character
- [ ] Shelving
- [ ] Vegetation matted down, bent or absent
- [ ] Leaf litter disturbed or washed away
- [ ] Sediment deposition
- [ ] Water staining
- Other (list):
- Presence of litter and debris
- Destruction of terrestrial vegetation
- Presence of wrack line
- Sediment sorting
- Scour
- Multiple observed or predicted flow events
- Abrupt change in plant community

[ ] Discontinuous? Explain: 
2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac): 
- Wetland Type, Explain: 
- Wetland Quality, Explain: 

Project Wetlands Cross or Serve as State Boundaries, Explain:

(b) General Flow Relationship with Non-TNW:

- Wetland Flow is: 
- Surface Flow is: 

- Characteristics: 
- Subsurface Flow: 

- Explain Findings: 

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW

- Discrete wetland hydrologic connection Explain: 
- Ecological connection Explain: 
- Separated by berm/barrier Explain: 

(d) Proximity (Relationship) to TNW

- Project Wetlands: River Miles from TNW: 
- Project Wetlands: Aerial Miles from TNW: 

- Flow is From: 

- Estimate approximate Location of Wetland within Floodplain: 

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

- Explain: 

Identify Specific Pollutants, if known:

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: 
- Wetland Fringe Characteristics: 

Habitat for:

- Federally Listed Species Explain findings: 
- Fish/Spawn Areas Explain findings: 
- Other environmentally-sensitive species Explain findings: 
- Aquatic/Wildlife diversity Explain: 

Project Wetlands:

- Aerial Miles from TNW: 

If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: 
- oil or scum line along shore objects 
- fine shell or debris deposits (foreshore) 
- physical markings/characteristics 
- tidal gauges 
- other 

- Mean High water Mark indicated by: 
- survey to available datum 
- physical markings 
- vegetation lines/changes in vegetation types
(ii) Chemical Characteristics:
Charaterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

☐ Riparian Buffer Characteristics (type, average width):

☐ Vegetation type/percent cover. Explain:

Habitat for:

☐ Federally Listed Species Explain:

☐ Fish/Spawn Areas Explain:

☐ Other environmentally-sensitive species Explain:

☐ Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?

• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?

• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs  Linear Feet: _______ Width (ft): _______ TNW Acres _______
   - Wetlands adjacent to TNWs: Acres: _______

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: _______
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: _______
     Provide estimates for jurisdictional waters in the review area (check all that apply):
     - Tributary waters  Linear Feet: _______ Width (ft): _______ Acres: _______
     - Other non-wetland waters: Acres: _______

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   Provide estimates of jurisdictional waters within the review area (check all that apply):
   Length (Linear Feet): _______ Width (ft): _______ Acres: _______

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: _______
     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: _______
     Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): ________ Acres: ________

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet : ________ width (ft): ________
☐ Other Non-wetland Waters MBR acres: ________
☐ Wetlands MBR acres: ________

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters ________ linear feet (ft), 241.59 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION
A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013
B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending
C. PROJECT LOCATION AND BACKGROUND INFORMATION:  
Drainage Feature  
AZ  Pinal County  N/A
Lat. 32.8482°N  Long. -111.2599°W
Gila River between Powers Butte and Gillespie Dam
15050100
☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g. offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.
D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)
☐ Office (Desk) Determination. Date: 
☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS
A. RHA SECTION 10 DETERMINATION OF JURISDICTION
There ☐ "navigable waters of the U.S. " within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329 in the review area.
☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.
B. CWA SECTION 404 DETERMINATION OF JURISDICTION
There ☐ "waters of the U.S. " within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.
1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands
   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:
   c. Limits (boundaries) of Jurisdiction based on:
2. Non-Regulated Waters/Wetlands (check if applicable):
   ☐ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________________
   □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary, it is considered a tributary for the purposes of jurisdiction.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.00396
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         □ Tributary flows directly to TNW
         ☑ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
- Average Width (ft): 
- Average Depth (ft): 
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Cobbles
- Gravel
- Substrate - Vegetation
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5
Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:
Subsurface Flow: No Explain:

Dye (or other) test performed:

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community

Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

☐ Riparian Buffer  Characteristics (type, average width):
☐ Vegetation type/percent cover. Explain:
Habitat for:
☐ Federally Listed Species  Explain:
☐ Fish/Spawn Areas  Explain:
☐ Other environmentally-sensitive species  Explain:
☐ Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - [ ] TNWs
   - [ ] Wetlands adjacent to TNWs

2. RPWs that flow directly or indirectly into TNWs
   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - [ ] Tributary waters
       - [ ] Other non-wetland waters

3. Non-RPWs that flow directly or indirectly into TNWs.
   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet):
     - Width (feet):
     - Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
   - Provide acreage estimates for jurisdictional wetland in the review area:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
   - Provide acreage estimates for jurisdictional wetland in the review area:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): _____ Acres: _____

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: _____ width (ft): _____
☐ Other Non-wetland Waters MBR acres: _____
☐ Wetlands MBR acres: _____

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters linear feet (ft), 597.11 width (ft), 4.30 acres
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☐ Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.
☐ Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant

☐ Office (Desk) Determination. Date:  
☒ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☐ TNWs (new)  
      ☐ Wetlands adjacent to TNWs  
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
      ☐ Non-RPWS that flow directly or indirectly into TNWs  
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Impoundments of jurisdictional waters  
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters Linear Feet Width (ft) and/or Acres

      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________________ ☐ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.00943
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      ☐ Tributary flows directly to TNW
      ☑ Tributary flows through 4 tributaries before entering TNW
      Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:
Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics
Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary; size in acres; overall biological, chemical or physical functions):

---

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

   □ TNWs Linear Feet: ______ Width (ft): ______ TNW Acres ______

   □ Wetlands adjacent to TNWs: Acres: ______

2. RPWs that flow directly or indirectly into TNWs

   □ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: ______

   □ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: ______

   Provide estimates for jurisdictional waters in the review area (check all that apply):

   □ Tributary waters Linear Feet: ______ Width (ft): ______

   □ Other non-wetland waters: Acres: ______

3. Non-RPWs that flow directly or indirectly into TNWs.

   □ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

   Provide estimates of jurisdictional waters within the review area (check all that apply):

   Length (Linear Feet): ______ Width (feet): ______ Acres: ______

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

   □ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

   □ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: ______

   □ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW ______

   Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   □ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

   Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.

   ______
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet):  
Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet:  
  width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters linear feet (ft),  
  width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:  
Drainage Feature 244
State: AZ  
County/Parish/borough: Pinal County  
City: N/A
Center coordinates of site:  
Lat. 32.8482°N  
Long. -111.2599°W
Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam
Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  
Gila River between Powers Butte and Gillespie Dam
Name of watershed or Hydrologic Unit Code (HUC): 15050100

☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)
☐ Office (Desk) Determination. Date:  
☑ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION
There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION
There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands
   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:
   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW:
   - Vegetation
   - Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   - Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   - (i) General Area Conditions:
     - Watershed Size (sq mi): 49650
     - Drainage Area (sq mi): 0.63884
     - Average Annual Rainfall (in): 10
     - Average Annual Snowfall (in): 0
   - (ii) Physical Characteristics:
     - (a) Relationship with TNW:
       - Tributary flows directly to TNW
       - Tributary flows through 4 tributaries before entering TNW
       - Project waters are 30 (or more) river miles from TNW
Feature ID: 244

U.S. Army Corps of Engineers

Project waters are river Miles from tributary to RPW: Explain:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: Explain:
Project waters are aerial (straight) miles from tributary to RPW: Explain:

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
Average Width (ft):
Average Depth (ft):
Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Côbbles
- Sand
- Concrete
- Muck
- Gravel
- Substrate - Vegetation
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Poll Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:

Subsurface Flow: No Explain:

☐ Dye (or other) test performed:

Tributary Has (Check all that apply):

☐ Bed and Banks
☐ OHWM (check all the apply): OHWM Indicators:
- Clear, natural line impressed on the bank
- Changes in soil character
- Shelving
- Vegetation matted down, bent or absent
- Leaf litter disturbed or washed away
- Sediment deposition
- Water staining
- Presence of litter and debris
- Destruction of terrestrial vegetation
- Presence of wrack line
- Sediment sorting
- Scour
- Multiple observed or predicted flow events
- Abrupt change in plant community

Other (list):

☐ Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by:  
- Mean High Water Mark indicated by:  
- Oil or scum line along shore objects  
- Fine shell or debris deposits (foreshore)  
- Physical markings/characteristics  
- Tidal gauges  
- Other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain:  

Identify Specific Pollutants, if known:  

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics:  
- Wetland Fringe Characteristics:  

Habitat for:

- Federally Listed Species Explain findings:  
- Fish/Spawn Areas Explain findings:  
- Other environmentally-sensitive species Explain findings:  
- Aquatic/Wildlife diversity Explain:

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac):  
- Wetland Type, Explain:  
- Wetland Quality, Explain:  

Project Wetlands Cross or Serve as State Boundaries, Explain:  

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: Explain:  

Surface Flow is:  

Subsurface Flow: Explain Findings:  

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW  
- Wetland Not Directly Abutting Non-TNW  
- Discrete wetland hydrologic connection Explain:  
- Ecological connection Explain:  
- Separated by berm/barrier Explain:  

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW:  
Project Wetlands: Aerial Miles from TNW:  
Flow is From:  
Estimate approximate Location of Wetland within Floodplain:  

Naturalized other shell debris
(ii) Chemical Characteristics:
Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).
Explain
Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer  Characteristics (type, average width):
- Vegetation type/percent cover. Explain:

Habitat for:
- Federally Listed Species  Explain:
- Fish/Spawn Areas  Explain:
- Other environmentally-sensitive species  Explain:
- Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.
Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

   [ ] TNWs      Linear Feet:    Width (ft):  TNW Acres
   [ ] Wetlands adjacent to TNWs:   Acres:

2. RPWs that flow directly or indirectly into TNWs

   [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

   [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

       Provide estimates for jurisdictional waters in the review are (check all that apply):
       [ ] Tributary waters      Linear Feet:    Width (Ft).
       [ ] Other non-wetland waters:   Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

   [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

       Provide estimates of jurisdictional waters within the review area (check all that apply):
       Length (Linear Feet):    Width (feet):  Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

   [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

       [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

       [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW

       Provide acreage estimates for jurisdictional wetland in the review area:   Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

       Provide acreage estimates for jurisdictional wetland in the review area:   Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters linear feet: 814.02 width (ft): 9.05
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

## SECTION II: SUMMARY OF FINDINGS

### A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

### B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):
   
   - ☐ TNWs (new)  
   - ☐ Wetlands adjacent to TNWs  
   - ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
   - ☐ Non-RPWs that flow directly or indirectly into TNWs  
   - ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
   - ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
   - ☐ Wetlands adjacent to non-RPWS that flow directly or indirectly into TNWs  
   - ☐ Impoundments of jurisdictional waters  
   - ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

   - Non-Wetlands waters Linear Feet Width (ft) and/or Acres  
   - Wetlands Acres:  

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS
A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

   Identify TNW: 
   \( \square \) Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      \[
      \begin{array}{|c|c|}
        \hline
        \text{Watershed Size (sq mi)} & 49650 \\
        \text{Drainage Area (sq mi)} & 0.46960 \\
        \text{Average Annual Rainfall (in)} & 10 \\
        \text{Average Annual Snowfall (in)} & 0 \\
        \hline
      \end{array}
      \]
   (ii) Physical Characteristics:
      \( \square \) Relationship with TNW
      \( \checkmark \) Tributary flows directly to TNW
      \( \checkmark \) Tributary flows through \( 4 \) tributaries before entering TNW
      Project waters are \( 30 \) (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:  
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:  
Project waters are aerial (straight) miles from tributary to RPW:  
Project waters cross or serve as state boundaries. Explain:  
Identify flow route to TNW: Towards the Santa Cruz flats through ephemeral tributaries, tributary to Picacho reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

### (b) General Tributary Characteristics

<table>
<thead>
<tr>
<th>Tributary is:</th>
<th>Natural</th>
<th>Explain:</th>
</tr>
</thead>
</table>

Tributary properties with respect to top of bank (estimate):

| Average Width (ft): |  
| Average Depth (ft): |  
| Average Side Slopes: | 3:1 |

Primary tributary substrate composition (check all that apply):

- Silts
- Sands
- Concrete
- Muck
- Gravel
- Substrate - Vegetation
- Other, Explain:  

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.]

Presence of Run/Riffle/PooI Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

### (c) Flow

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:  

Surface Flow is: Discrete and Confined  
Subsurface Flow: No  
Dye (or other) test performed:  

Tributary Has (Check all that apply):

- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community
  - Other (list):  
  - Discontinuous? Explain:  
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: [ ]
- Mean High water Mark indicated by: [ ]
- oil or scum line along shore objects [ ]
- fine shell or debris deposits (foreshore) [ ]
- physical markings/characteristics [ ]
- tidal gauges [ ]
- other [ ]

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: 

Identify Specific Pollutants, if known:

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics:
- Wetland Fringe Characteristics:

Habitat for:

- Federally Listed Species Explain findings:
- Fish/Spawn Areas Explain findings:
- Other environmentally-sensitive species Explain findings:
- Aquatic/Wildlife diversity Explain:

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:
- Wetland Size (ac): __________
- Wetland Type, Explain: __________
- Wetland Quality, Explain: __________

Project Wetlands Cross or Serve as State Boundaries, Explain:

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: __________ Explain: __________

Surface Flow is:

Characteristics: __________

Subsurface Flow: __________ Explain Findings: __________

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW [ ]
- Wetland Not Directly Abutting Non-TNW [ ]
  - Discrete wetland hydrologic connection Explain: __________
  - Ecological connection Explain: __________
  - Separated by berm/ barrier Explain: __________

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: __________

Project Wetlands: Aerial Miles from TNW: __________

Flow is From: __________

Estimate approximate Location of Wetland within Floodplain: __________
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if known:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer Characteristics (type, average width):
- Vegetation type/percent cover. Explain:

Habitat for:

- Federally Listed Species Explain:
- Fish/Spawn Areas Explain:
- Other environmentally-sensitive species Explain:
- Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?, size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT Nexus DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- TNWs Linear Feet: ______ Width (ft): ______ TNW Acres ______
- Wetlands adjacent to TNWs: Acres: ______

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: ______

- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: ______

  Provide estimates for jurisdictional waters in the review area (check all that apply):

  - Tributary waters Linear Feet: ______ Width (ft): ______
  - Other non-wetland waters: Acres: ______

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

  Provide estimates of jurisdictional waters within the review area (check all that apply):

  Length (Linear Feet): ______ Width (feet): ______ Acres: ______

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: ______

  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: ______

  Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

  Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): _______ Acres: _______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): __________ linear feet: _______ width (ft): _______

☐ Other Non-wetland Waters MBR _______ acres:

☐ Wetlands MBR _______ acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters _______ 952.52 linear feet (ft), _______ 13.76 width (ft)

☐ Other waters _______ acres

☐ Wetlands _______ acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:  
Drainage Feature 246

State: AZ  
County/Parish/borough: Pinal County  
City: N/A

Center coordinates of site: Lat. 32.8482°N  Long. -111.2599°W

Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  
Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:  
☐ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No" navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No" waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):

☐ TNWs (new)
☐ Wetlands adjacent to TNWs
☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
☐ Non-RPWs that flow directly or indirectly into TNWs
☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
☐ Impoundments of jurisdictional waters
☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

Non-Wetlands waters Linear Feet Width (ft) and/or Acres

Wetlands Acres: 

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS
A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**

   Identify TNW: [ ] Vegetation

   Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) **General Area Conditions:**

   - Watershed Size (sq mi): 49650
   - Drainage Area (sq mi): 24.40403
   - Average Annual Rainfall (in): 10
   - Average Annual Snowfall (in): 0

   (ii) **Physical Characteristics:**

      (a) **Relationship with TNW**

      [ ] Tributary flows directly to TNW
      [ ] Tributary flows through 4 tributaries before entering TNW

      Project waters are 30 (or more) river miles from TNW
**Feature ID:** 246

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis: ________________________________________________

Wetland acres in total being considered in cumulative analysis: ____________________________________________

Describe each wetland (directly abuts tributary?, size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- TNWs Linear Feet: _______ Width (ft): _______ TNW Acres _______
- Wetlands adjacent to TNWs: Acres: _______

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: _______
- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: _______

Provide estimates for jurisdictional waters in the review area (check all that apply):

- Tributary waters Linear Feet: _______ Width (Ft): _______
- Other non-wetland waters: Acres: _______

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

Provide estimates of jurisdictional waters within the review area (check all that apply):

Length (Linear Feet): _______ Width (feet): _______ Acres: _______

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: _______
  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: _______

Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C..

Provide estimates for jurisdictional wetland in the review area (in acres): __________

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: __________

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale: __________

Length (linear feet): __________ Acres: __________

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: __________ width (ft): __________

☐ Other Non-wetland Waters MBR acres: __________

☐ Wetlands MBR acres: __________

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 2750.38 linear feet (ft), 17.36 width (ft)

☐ Other waters acres

☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

   Long.: -111.2599°W
   
   **Name of nearest waterbody:**  
   Gila River between Powers Butte and Gillespie Dam
   
   **Name of watershed or Hydrologic Unit Code (HUC):**  
   15050100
   
   ☑ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
   ❑ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

**SECTION II: SUMMARY OF FINDINGS**

A. **RHA SECTION 10 DETERMINATION OF JURISDICTION**
   
   There **No** "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.
   
   ❑ Waters subject to the ebb and flow of the tide.
   ❑ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. **CWA SECTION 404 DETERMINATION OF JURISDICTION**
   
   There **No** "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.
   
   1. **Waters of the U.S.**
      
      a. **Indicate presence of water of U.S. in review area (Check all the apply):**
         
         ☑ TNWs (new)
         ☑ Wetlands adjacent to TNWs
         ☑ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
         ☑ Non-RPWs that flow directly or indirectly into TNWs
         ☑ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
         ☑ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
         ☑ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
         ☑ Impoundments of jurisdictional waters
         ☑ Isolated (interstate or intrastate) waters, including isolated wetlands
      
      b. **Identify (estimate) size of waters of the U.S. in the review area**
         
         Non-Wetlands waters [ ] Linear Feet [ ] Width (ft) and/or [ ] Acres
         
         Wetlands Acres: [ ]
      
      c. **Limits (boundaries) of Jurisdiction based on:**
         
         2. **Non-Regulated Waters/Wetlands (check if applicable):**
         
         ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
         
         **Explain:** Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________________________________ ☐ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.10777
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         ☐ Tributary flows directly to TNW
         ☑ Tributary flows through 4 tributaries before entering TNW

Project waters are 30 (or more) river miles from TNW
Project waters are [ ] river Miles from tributary to RPW: 
Project waters are [ ] 30 (or more) aerial (straight) miles from tributary to TNW: 
Project waters are [ ] aerial (straight) miles from tributary to RPW: 
Project waters cross or serve as state boundaries. Explain: 
Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

<table>
<thead>

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer Characteristics (type, average width):  
- Vegetation type/percent cover. Explain:  

Habitat for:
- Federally Listed Species Explain:  
- Fish/Spawn Areas Explain:  
- Other environmentally-sensitive species Explain:  
- Aquatic/Wildlife Diversity Explain:  

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:  
Wetland acres in total being considered in cumulative analysis:  
Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.  
Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

<table>
<thead>
<tr>
<th>TNWs</th>

</thead>
</table>

<table>
<thead>
<tr>
<th>Other non-wetland waters:</th>
<th>Acres:</th>
</tr>
</thead>
</table>

3. Non-RPWs that flow directly or indirectly into TNWs.

| Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c. |

Provide estimates of jurisdictional waters within the review area (check all that apply):

<table>
<thead>
<tr>
<th>Length (Linear Feet):</th>
<th>Width (feet):</th>
<th>Acres:</th>
</tr>
</thead>
</table>

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

| Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands. |

| Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: |

| Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: |

Provide acreage estimates for jurisdictional wetland in the review area: Acres: |

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

| Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C. |

Provide acreage estimates for jurisdictional wetland in the review area: Acres: |

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): [ ] Acres: [ ]

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section III.C.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- [ ] Non wetland-Waters (i.e., rivers, streams): linear feet: [ ] width (ft): [ ]
- [ ] Other Non-wetland Waters MBR acres: [ ]
- [ ] Wetlands MBR acres: [ ]

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- [ ] Non-wetland waters 1094.93 linear feet (ft), 8.73 width (ft)
- [ ] Other waters acres
- [ ] Wetlands acres

SECTION IV: DATA SOURCES

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION  
There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.  
☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION  
There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.  

1. Waters of the U.S.  
a. Indicate presence of water of U.S. in review area (Check all the apply):  
☐ TNWs (new)  
☐ Wetlands adjacent to TNWs  
☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
☐ Non-RPWs that flow directly or indirectly into TNWs  
☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
☐ Impoundments of jurisdictional waters  
☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area  
Non-Wetlands waters Linear Feet Width (ft) and/or Acres  
Wetlands Acres: 

c. Limits (boundaries) of Jurisdiction based on:  

2. Non-Regulated Waters/Wetlands (check if applicable):  
☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:  

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: _________________________ ■ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      - Watershed Size (sq mi): 49650
      - Drainage Area (sq mi): 0.01448
      - Average Annual Rainfall (in): 10
      - Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         - □ Tributary flows directly to TNW
         - ✔ Tributary flows through 4 tributaries before entering TNW
         - Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW: 
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: 
Project waters are aerial (straight) miles from tributary to RPW: 
Project waters cross or serve as state boundaries. Explain: 

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain: 

Tributary properties with respect to top of bank (estimate):
Average Width (ft): 
Average Depth (ft): 
Average Side Slopes: 3:1 

Primary tributary substrate composition (check all that apply):

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

   Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

   This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

### D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. **TNWs and Adjacent Wetlands.** Check all that apply and provide size estimates in review area:

   - [ ] TNWs
   - [ ] Wetlands adjacent to TNWs

   

2. **RPWs that flow directly or indirectly into TNWs**

   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

      Provide estimates for jurisdictional waters in the review area (check all that apply):
      - [ ] Tributary waters
      - [ ] Other non-wetland waters

3. **Non-RPWs that flow directly or indirectly into TNWs.**

   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

   Provide estimates of jurisdictional waters within the review area (check all that apply):
   - Length (Linear Feet):
   - Width (feet):
   - Acres:

4. **Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.**

   - [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:

      Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. **Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW**

   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

      Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. **Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.**
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C..

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters 979.67 linear feet (ft), width (ft):
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329 in the review area.

☐ Waters subject to the ebb and flow of the tide. 

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):

      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area

      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

      2. Non-Regulated Waters/Wetlands (check if applicable):

         ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

         Explain:  

         Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________________ □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

   This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

   The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

   A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

   If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.04369
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
   (a) Relationship with TNW
       ☑ Tributary flows through 4 tributaries before entering TNW
       ☐ Tributary flows directly to TNW
       Project waters are 30 (or more) river miles from TNW
PROJECT WATERS ARE 30 (OR MORE) AERIAL (STRAIGHT) MILES FROM TRIBUTARY TO RPW:

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?

• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?

• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

**D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)**

1. **TNWs and Adjacent Wetlands.** Check all that apply and provide size estimates in review area:

   - ☐ TNWs  Linear Feet:  Width (ft):  TNW Acres
   - ☐ Wetlands adjacent to TNWs:  Acres:

2. **RPWs that flow directly or indirectly into TNWs**

   - ☐ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - ☐ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - ☐ Tributary waters  Linear Feet:  Width (Ft).
       - ☐ Other non-wetland waters:  Acres:

3. **Non-RPWs that flow directly or indirectly into TNWs.**

   - ☐ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
   - Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet):  Width (feet):  Acres:

4. **Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.**

   - ☐ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - ☐ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - ☐ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:
       - Provide acreage estimates for jurisdictional wetland in the review area:  Acres:

5. **Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW**

   - ☐ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
   - Provide acreage estimates for jurisdictional wetland in the review area:  Acres:

6. **Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.**
☐ Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C..

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

List of wetland factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non-wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
☐ Other Non-wetland Waters MBR acres:
☐ Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters 1017.80 linear feet (ft), 6.44 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

### D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date: 

☑ Field Determination. Date(s): 10/2012

### SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      - ☐ TNWs (new)
      - ☐ Wetlands adjacent to TNWs
      - ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      - ☐ Non-RPWs that flow directly or indirectly into TNWs
      - ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      - ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      - ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      - ☐ Impoundments of jurisdictional waters
      - ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      - Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      - Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   - Identify TNW: [ ]
   - ☐ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e., tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary, that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
      - Watershed Size (sq mi): 49650
      - Drainage Area (sq mi): 0.17982
      - Average Annual Rainfall (in): 10
      - Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
      - ☐ Relationship with TNW
        - ☑ Tributary flows through 4 tributaries before entering TNW
        - Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW: 
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: 
Project waters are aerial (straight) miles from tributary to RPW: 
Project waters cross or serve as state boundaries. Explain: 
Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain: 
Tributary properties with respect to top of bank (estimate):
- Average Width (ft): 
- Average Depth (ft): 
- Average Side Slopes: 3:1 

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Cobbles
- Gravel
- Substrate - Vegetation
- Other, Explain: 

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume: 

Surface Flow is: Discrete and Confined Characteristics: 
Subsurface Flow: No Explain: 

☐ Dye (or other) test performed: 

Tributary Has (Check all that apply):

☐ Bed and Banks
☐ OHWM (check all the apply): OHWM Indicators:
- Clear, natural line impressed on the bank
- Changes in soil character
- Shelving
- Vegetation matted down, bent or absent
- Leaf litter disturbed or washed away
- Sediment deposition
- Water staining
- Presence of litter and debris
- Destruction of terrestrial vegetation
- Presence of wrack line
- Sediment sorting
- Scour
- Multiple observed or predicted flow events
- Abrupt change in plant community

Other (list): 

☐ Discontinuous? Explain: 

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain:

Identify Specific Pollutants, if known:

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics:
- Wetland Fringe Characteristics:

Habitat for:

- Federally Listed Species Explain findings:
- Fish/Spawn Areas Explain findings:
- Other environmentally-sensitive species Explain findings:
- Aquatic/Wildlife diversity Explain:

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac):
- Wetland Type, Explain:
- Wetland Quality, Explain:

Project Wetlands Cross or Serve as State Boundaries, Explain:

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: Explain:

Surface Flow is:

Characteristics:

Subsurface Flow: Explain Findings:

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW
  - Discrete wetland hydrologic connection Explain:
  - Ecological connection Explain:
  - Separated by berm/barrier Explain:

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW:
Project Wetlands: Aerial Miles from TNW:
Flow is From:

Estimate approximate Location of Wetland within Floodplain:
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- ☐ Riparian Buffer Characteristics (type, average width):
- ☐ Vegetation type/percent cover. Explain:
- ☐ Habitat for:
  - ☐ Federally Listed Species Explain:
  - ☐ Fish/Spawn Areas Explain:
  - ☐ Other environmentally-sensitive species Explain:
  - ☐ Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downdrgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- TNWs  
  Linear Feet:  
  Width (ft):  
  TNW Acres:  

- Wetlands adjacent to TNWs  
  Acres:  

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:  

- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:  

  Provide estimates for jurisdictional waters in the review area (check all that apply):  
  - Tributary waters  
    Linear Feet:  
    Width (Ft):  
  - Other non-wetland waters  
    Acres:  

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

  Provide estimates of jurisdictional waters within the review area (check all that apply):  
  Length (Linear Feet):  
  Width (feet):  
  Acres:  

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:  

  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:  

    Provide acreage estimates for jurisdictional wetland in the review area:  
    Acres:  

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

  Provide acreage estimates for jurisdictional wetland in the review area:  
  Acres:  

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Feature ID: 25

☑ Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres): 

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: 

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres: 

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters 

Explain finding of no Significant Nexus: See Section III C.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet : width (ft): 

☐ Other Non-wetland Waters MBR acres: 

☐ Wetlands MBR acres: 

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 933.76 linear feet (ft), 13.10 width (ft)

☐ Other waters 

☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☐ Office (Desk) Determination. Date:  
☐ Field Determination. Date(s): 10/2012

**SECTION II: SUMMARY OF FINDINGS**

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

   a. Indicate presence of water of U.S. in review area (Check all the apply):  
   ☐ TNWs (new)  
   ☐ Wetlands adjacent to TNWs  
   ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
   ☐ Non-RPWs that flow directly or indirectly into TNWs  
   ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
   ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
   ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
   ☐ Impoundments of jurisdictional waters  
   ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area  
   Non-Wetlands waters Linear Feet Width (ft) and/or Acres  
   Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):  
☐ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

   Identify TNW: ____________________________ □ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.00396
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   □ Tributary flows directly to TNW
   ☑ Tributary flows through 4 tributaries before entering TNW

   Project waters are 30 (or more) river miles from TNW
**Approved Jurisdictional Determination Form**

**Feature ID:** 250

Project waters are [ ] river Miles from tributary to RPW:

Project waters are [ ] 30 (or more) aerial (straight) miles from tributary to TNW:

Project waters are [ ] aerial (straight) miles from tributary to RPW:

Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

### (b) General Tributary Characteristics

- Surface Flow is: ____________________________

Characteristics: ____________________________

Subsurface Flow: ____________________________ Explain Findings: ____________________________

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW
  - Discrete wetland hydrologic connection Explain: ____________________________
  - Ecological connection Explain: ____________________________
  - Separated by berm/barrier Explain: ____________________________

(d) Proximity (Relationship) to TNW

- Project Wetlands: River Miles from TNW: ____________________________
- Project Wetlands: Aerial Miles from TNW: ____________________________

Flow is From: ____________________________

Estimate approximate Location of Wetland within Floodplain: ____________________________
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer Characteristics (type, average width):
- Vegetation type/percent cover. Explain:

Habitat for:
- Federally Listed Species Explain:
- Fish/Spawn Areas Explain:
- Other environmentally-sensitive species Explain:
- Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. **TNWs and Adjacent Wetlands.** Check all that apply and provide size estimates in review area:

   - TNWs Linear Feet: _______ Width (ft): _______ TNW Acres _______
   - Wetlands adjacent to TNWs: Acres: _______

2. **RPWs that flow directly or indirectly into TNWs**

   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

     Provide estimates for jurisdictional waters in the review area (check all that apply):
     - Tributary waters Linear Feet: _______ Width (ft): _______
     - Other non-wetland waters: Acres: _______

3. **Non-RPWs that flow directly or indirectly into TNWs.**

   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

     Provide estimates of jurisdictional waters within the review area (check all that apply):
     - Length (Linear Feet): _______ Width (feet): _______ Acres: _______

4. **Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.**

   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:

     Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

5. **Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW**

   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

     Provide acreage estimates for jurisdictional wetland in the review area: Acres: _______

6. **Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.**
250

Feature ID: [250]

Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): [ ] Acres: [ ]

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section III.C.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: [ ] width (ft): [ ]
☐ Other Non-wetland Waters MBR acres: [ ]
☐ Wetlands MBR acres: [ ]

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 43.58 linear feet (ft), 2.47 width (ft)
☐ Other waters [ ] acres
☐ Wetlands [ ] acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There  Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There  Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters  Linear Feet Width (ft) and/or Acres
      Wetlands Acres: 

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Draining is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ________________________________ ☐ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.09409
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
       (a) Relationship with TNW
           ☐ Tributary flows directly to TNW
           ☑ Tributary flows through 4 tributaries before entering TNW
           Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- ☐ Riparian Buffer  Characteristics (type, average width):
- ☐ Vegetation type/percent cover. Explain:

Habitat for:
- ☐ Federally Listed Species  Explain:
- ☐ Fish/Spawn Areas  Explain:
- ☐ Other environmentally-sensitive species  Explain:
- ☐ Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downward flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

☐ TNWs Linear Feet: Width (ft): TNW Acres
☐ Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs

☐ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

☐ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

Provide estimates for jurisdictional waters in the review area (check all that apply):

☐ Tributary waters Linear Feet: Width (Ft).
☐ Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

☐ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.

Provide estimates of jurisdictional waters within the review area (check all that apply):

Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

☐ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

☐ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

☐ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:

Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

☐ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Feature ID: 251

Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATEDWATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet):  
Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters
Explain finding of no Significant Nexus: See Section III.C.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non-wetland-Waters (i.e., rivers, streams): length:  
  width (ft):  
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters  605.56 linear feet (ft),  13.29 width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

APPROVED JURISDICTIONAL DETERMINATION FORM
U.S. Army Corps of Engineers

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION
A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER 
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: 
Drainage Feature 252

State: AZ  County/Parish/borough: Pinal County  City: N/A
Center coordinates of site: Lat. 32.8482°N  Long. -111.2599°W
Name of nearest waterbody: 
Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: 
Gila River between Powers Butte and Gillespie Dam
Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)
☐ Office (Desk) Determination. Date: 
☐ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS
A. RHA SECTION 10 DETERMINATION OF JURISDICTION
There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.
☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION
There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands
   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters  Linear Feet  Width (ft) and/or Acres
      Wetlands Acres:  
   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTIOIN III: CWA ANALYSIS
A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary, this determination must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 1.71649
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
   (a) Relationship with TNW
   □ Tributary flows directly to TNW
   ✔ Tributary flows through 4 tributaries before entering TNW
   Project waters are 30 (or more) river miles from TNW
Feature ID: 252

U.S Army Corps of Engineers

Project waters are river Miles from tributary to RPW:

Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:

Project waters are aerial (straight) miles from tributary to RPW:

Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):

Average Width (ft):

Average Depth (ft):

Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):

- [ ] Silts
- [ ] Sands
- [ ] Concrete
- [ ] Muck
- [ ] Gravel
- [ ] Substrate - Vegetation
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:

Subsurface Flow: No Explain:

Dye (or other) test performed:

Tributary Has (Check all that apply):

- [ ] Bed and Banks
- [ ] OHWM (check all the apply): OHWM Indicators:
  - [ ] Clear, natural line impressed on the bank
  - [ ] Changes in soil character
  - [ ] Shelving
  - [ ] Vegetation matted down, bent or absent
  - [ ] Leaf litter disturbed or washed away
  - [ ] Sediment deposition
  - [ ] Water staining
  - Other (list):
- [ ] Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by:
- Oil or scum line along shore objects
- Fine shell or debris deposits (foreshore)
- Physical markings/characteristics
- Tidal gauges
- Other

- Mean High water Mark indicated by:
- Survey to available datum
- Physical markings
- Vegetation lines/changes in vegetation types

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain:

Identify Specific Pollutants, if known:

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics:
- Wetland Fringe Characteristics:

Habitat for:

- Federally Listed Species Explain findings:
- Fish/Spawn Areas Explain findings:
- Other environmentally-sensitive species Explain findings:
- Aquatic/Wildlife diversity Explain:

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:
- Wetland Size (ac):
- Wetland Type, Explain:
- Wetland Quality, Explain:

Project Wetlands Cross or Serve as State Boundaries, Explain:

(b) General Flow Relationship with Non-TNW:

- Wetland Flow is: Explain:
- Surface Flow is:

Characteristics:

Subsurface Flow: Explain Findings:

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW

- Discrete wetland hydrologic connection Explain:
- Ecological connection Explain:
- Separated by berm/barrier Explain:

(d) Proximity (Relationship) to TNW

- Project Wetlands: River Miles from TNW:
- Project Wetlands: Aerial Miles from TNW:

Flow is From:

Estimate approximate Location of Wetland within Floodplain:
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer Characteristics (type, average width): 
- Vegetation type/percent cover. Explain: 

Habitat for:
- Federally Listed Species Explain: 
- Fish/Spawn Areas Explain: 
- Other environmentally-sensitive species Explain: 
- Aquatic/Wildlife Diversity Explain: 

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis: 

Wetland acres in total being considered in cumulative analysis: 

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage.
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

   - TNWs
   - Wetlands adjacent to TNWs:

2. RPWs that flow directly or indirectly into TNWs

   - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

     - Provide estimates for jurisdictional waters in the review area (check all that apply):

       - Tributary waters
       - Other non-wetland waters:

3. Non-RPWs that flow directly or indirectly into TNWs.

   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.

   - Provide estimates of jurisdictional waters within the review area (check all that apply):

     - Length (Linear Feet):
     - Width (feet):
     - Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

   - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:

     - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:

       - Provide acreage estimates for jurisdictional wetland in the review area:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

   - Provide acreage estimates for jurisdictional wetland in the review area:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): _____ Acres: _____

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: _____ width (ft): _____

☐ Other Non-wetland Waters MBR acres: _____

☐ Wetlands MBR acres: _____

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 663.14 linear feet (ft), 17.29 width (ft)

☐ Other waters acres

☐ Wetlands acres

SECTION IV: DATA SOURCES

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 253

State: AZ  
County/Parish/borough: Pinal County  
City: N/A

Center coordinates of site: Lat. 32.8482°N Long. -111.2599°W

Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   
a. Indicate presence of water of U.S. in review area (Check all the apply):
   
☐ TNWs (new)  
☐ Wetlands adjacent to TNWs  
☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
☐ Non-RPWs that flow directly or indirectly into TNWs  
☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
☐ Impoundments of jurisdictional waters  
☐ Isolated (interstate or intrastate) waters, including isolated wetlands
   
   b. Identify (estimate) size of waters of the U.S. in the review area

   Non-Wetlands waters [ ] Linear Feet [ ] Width (ft) and/or [ ] Acres
   
   Wetlands Acres: [ ]

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☐ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
   
   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs
The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ___________________________  □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)
This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.01487
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         □ Tributary flows directly to TNW
         ✔ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

**General Tributary Characteristics**

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- □ TNWs Linear Feet: __________________ Width (ft): ______ TNW Acres ______
- □ Wetlands adjacent to TNWs: Acres: ______

2. RPWs that flow directly or indirectly into TNWs

- □ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: ______
- □ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: ______

Provide estimates for jurisdictional waters in the review area (check all that apply):

- □ Tributary waters Linear Feet: ______ Width (Ft). ______
- □ Other non-wetland waters: Acres: ______

3. Non-RPWs that flow directly or indirectly into TNWs.

- □ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.

Provide estimates of jurisdictional waters within the review area (check all that apply):

Length (Linear Feet): ______ Width (feet): ______ Acres: ______

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- □ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

- □ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: ______

- □ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: ______

Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- □ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- [ ] Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- [ ] Other Non-wetland Waters MBR acres:
- [ ] Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- [ ] Non-wetland waters linear feet (ft), width (ft)
- [ ] Other waters acres
- [ ] Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

Findings:
There ☐ Are No “navigable waters of the U.S.” within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.
☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

Findings:
There ☐ Are No “waters of the U.S.” within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☐ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS
A. TNWs AND WETLANDS ADJACENT TO TNWs
The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
Identify TNW: ____________________________  □ Vegetation
Summarize rationale supporting determination:

2. Wetland adjacent to TNW
Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)
This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

Describe each wetland (directly abuts tributary?, size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

☐ TNWs Linear Feet: __________ Width (ft): __________ TNW Acres: __________

☐ Wetlands adjacent to TNWs: Acres: __________

2. RPWs that flow directly or indirectly into TNWs

☐ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: ____________________________

☐ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: ____________________________

Provide estimates for jurisdictional waters in the review area (check all that apply):

☐ Tributary waters Linear Feet: __________ Width (ft): __________ Acres: __________

☐ Other non-wetland waters: Acres: __________

3. Non-RPWs that flow directly or indirectly into TNWs.

☐ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

Provide estimates of jurisdictional waters within the review area (check all that apply):

Length (Linear Feet): __________ Width (feet): __________ Acres: __________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

☐ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

☐ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: ____________________________

☐ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: ____________________________

Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

☐ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
☐ Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C..

Provide estimates for jurisdictional wetland in the review area (in acres): □

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction: □

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): □ Acres: □

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters □

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non-wetland-Waters (i.e., rivers, streams): linear feet: □ width (ft): □
☐ Other Non-wetland Waters MBR acres: □
☐ Wetlands MBR acres: □

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters 54.98 linear feet (ft), 2.42 width (ft)
☐ Other waters acres □
☐ Wetlands acres □

SECTION IV: DATA SOURCES

Additional Comments to Support JD:

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION:  
Drainage Feature 255

State: AZ  
County/Parish/borough: Pinal  
City: N/A

Center coordinates of site: Lat. 32.8482°N  
Long. -111.2599°W

Name of nearest waterbody:  
Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  
Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request

☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):

☐ TNWs (new)

☐ Wetlands adjacent to TNWs

☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs

☐ Non-RPWs that flow directly or indirectly into TNWs

☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs

☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs

☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs

☐ Impoundments of jurisdictional waters

☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

Non-Wetlands waters Linear Feet Width (ft) and/or Acres

Wetlands Acres: 

c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: _____________________________ ☐ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.86799
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
      (a) Relationship with TNW
         ☐ Tributary flows directly to TNW
         ☑ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW: 
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW: 
Project waters are aerial (straight) miles from tributary to RPW: 
Project waters cross or serve as state boundaries. Explain: 
Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain: 
Tributary properties with respect to top of bank (estimate):
  Average Width (ft): 
  Average Depth (ft): 
  Average Side Slopes: 3:1 
Primary tributary substrate composition (check all that apply):
  ✗ Silts  ☐ Sands  ☐ Concrete  ☐ Muck
  ☐ Cobble  ☐ Gravel  ✗ Substrate - Vegetation  Other, Explain: 
Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.
  Presence of Run/Riffle/Pool Complexes. Explain: Not present.
Tributary Geometry: Relatively Straight
  Tributary Gradient (approximate average slope): 1%
(c) Flow:
  Tributary Provides for: Ephemeral Flow
  Estimate average number of flow events in review area/year: 2-5
  Describe Flow Regime: Ephemeral.
  Other Information on Duration and Volume: 
  Surface Flow is: Discrete and Confined Characteristics: 
  Subsurface Flow: No Explain: 
  ☐ Dye (or other) test performed: 
  Tributary Has (Check all that apply):
  ☐ Bed and Banks
  ☑ OHWM (check all the apply): OHWM Indicators:
    ✗ Clear, natural line impressed on the bank
    ☑ Changes in soil character
    ☐ Shelving
    ☐ Vegetation matted down, bent or absent
    ☐ Leaf litter disturbed or washed away
    ☐ Sediment deposition
    ☐ Water staining
    Other (list): 
  ☐ Discontinuous? Explain: 
  Presence of litter and debris
  ☐ Destruction of terrestrial vegetation

  ☐ Abrupt change in plant community
  ☐ Other (list): 
  ☐ Discontinuous? Explain: 
  Presence of litter and debris
  ☐ Destruction of terrestrial vegetation
  ☐ Presence of wrack line
  ☐ Sediment sorting
  ☐ Scour
  ☐ Multiple observed or predicted flow events
  ☐ Abrupt change in plant community
  ☐ Other (list): 
  ☐ Discontinuous? Explain: 
  Presence of litter and debris
  ☐ Destruction of terrestrial vegetation
  ☐ Presence of wrack line
  ☐ Sediment sorting
  ☐ Scour
  ☐ Multiple observed or predicted flow events
  ☐ Abrupt change in plant community
  ☐ Other (list): 
  ☐ Discontinuous? Explain: 
  Presence of litter and debris
  ☐ Destruction of terrestrial vegetation
  ☐ Presence of wrack line
  ☐ Sediment sorting
  ☐ Scour
  ☐ Multiple observed or predicted flow events
  ☐ Abrupt change in plant community
  ☐ Other (list): 
  ☐ Discontinuous? Explain: 
  Presence of litter and debris
  ☐ Destruction of terrestrial vegetation
  ☐ Presence of wrack line
  ☐ Sediment sorting
  ☐ Scour
  ☐ Multiple observed or predicted flow events
  ☐ Abrupt change in plant community
  ☐ Other (list): 
  ☐ Discontinuous? Explain: 
  Presence of litter and debris
  ☐ Destruction of terrestrial vegetation
  ☐ Presence of wrack line
  ☐ Sediment sorting
  ☐ Scour
  ☐ Multiple observed or predicted flow events
  ☐ Abrupt change in plant community
  ☐ Other (list):
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: __________
- Mean High water Mark indicated by: __________
- oil or scum line along shore objects
- fine shell or debris deposits (foreshore)
- physical markings/characteristics
- tidal gauges
- other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain: __________

Identify Specific Pollutants, if known:

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics: __________
- Wetland Fringe Characteristics: __________

Habitat for:

- Federally Listed Species Explain findings: __________
- Fish/Spawn Areas Explain findings: __________
- Other environmentally-sensitive species Explain findings: __________
- Aquatic/Wildlife diversity Explain: __________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac): __________
- Wetland Type, Explain: __________
- Wetland Quality, Explain: __________

Project Wetlands Cross or Serve as State Boundaries, Explain: __________

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: __________

Surface Flow is: __________

Characteristics: __________

Subsurface Flow: __________

Explain Findings: __________

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW

- Discrete wetland hydrologic connection Explain: __________
- Ecological connection Explain: __________
- Separated by berm/barrier Explain: __________

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: __________

Project Wetlands: Aerial Miles from TNW: __________

Flow is From: __________

Estimate approximate Location of Wetland within Floodplain: __________
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: etc.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer Characteristics (type, average width):

- Vegetation type/percent cover. Explain:

Habitat for:

- Federally Listed Species Explain:

- Fish/Spawn Areas Explain:

- Other environmentally-sensitive species Explain:

- Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

      ☐ Impoundments of jurisdictional waters  
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area  
      Non-Wetlands waters [ ] Linear Feet [ ] Width (ft) and/or [ ] Acres  
      Wetlands Acres: [ ]

   c. Limits (boundaries) of Jurisdiction based on:  
      [ ]

2. Non-Regulated Waters/Wetlands (check if applicable):  
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:  
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ___________________________  □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
       Watershed Size (sq mi): 49650
       Drainage Area (sq mi): 0.10957
       Average Annual Rainfall (in): 10
       Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
       (a) Relationship with TNW
           ☑ Tributary flows directly to TNW  □ Tributary flows through ___ tributaries before entering TNW
           Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
Average Width (ft):
Average Depth (ft):
Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- [ ] Silts
- [ ] Sands
- [ ] Concrete
- [ ] Muck
- [ ] Cobble
- [ ] Gravel
- [ ] Substrate - Vegetation
Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5
Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:
Subsurface Flow: No Explain:

☐ Dye (or other) test performed:

Tributary Has (Check all that apply):
- [ ] Bed and Banks
- [ ] OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community

Other (list):

☐ Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by:  
- Oil or scum line along shore objects  
- Fine shell or debris deposits (foreshore)  
- Physical markings/characteristics  
- Tidal gauges  
- Other

- Mean High water Mark indicated by:  
- Survey to available datum  
- Physical markings  
- Vegetation lines/changes in vegetation types

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain:

Identify Specific Pollutants, if known:

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics:
- Wetland Fringe Characteristics:

Habitat for:

- Federally Listed Species Explain findings:
- Fish/Spawn Areas Explain findings:
- Other environmentally sensitive species Explain findings:
- Aquatic/Wildlife diversity Explain:

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics

Properties:

- Wetland Size (ac):
- Wetland Type, Explain:
- Wetland Quality, Explain:

Project Wetlands Cross or Serve as State Boundaries, Explain:

(b) General Flow Relationship with Non-TNW:

Wetland Flow is: Explain:

Surface Flow is: Explain:

Characteristics: Explain:

Subsurface Flow: Explain Findings:

(c) Wetland Adjacency Determination with Non-TNW:

- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW

- Discrete wetland hydrologic connection Explain:
- Ecological connection Explain:
- Separated by berm/barrier Explain:

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW:

Project Wetlands: Aerial Miles from TNW:

Flow is From:

Estimate approximate Location of Wetland within Floodplain:
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain: 

Identify specific pollutants, if known.

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer: Characteristics (type, average width): 
- Vegetation type/percent cover. Explain: 
- Habitat for:
  - Federally Listed Species: Explain: 
  - Fish/Spawn Areas: Explain: 
  - Other environmentally-sensitive species: Explain: 
  - Aquatic/Wildlife Diversity: Explain: 

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis: 

Wetland acres in total being considered in cumulative analysis: 

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: The above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- [ ] TNWs
  - Linear Feet: 
  - Width (ft): 
  - TNW Acres

- [ ] Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs

- [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:

- [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
  - Provide estimates for jurisdictional waters in the review area (check all that apply):
    - [ ] Tributary waters
      - Linear Feet: 
      - Width (Ft):
    - [ ] Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.

- [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
  - Provide estimates of jurisdictional waters within the review area (check all that apply):
    - Length (Linear Feet): 
    - Width (feet): 
    - Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
  - Provide acreage estimates for jurisdictional wetland in the review area: Acres:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.

---

Expression of Wetlands, Tributaries, and Waters:

- [ ] Provide a definition and location for each.

- [ ] Use appropriate terms such as: Wetlands, Wetland, Wetlands, Tributaries, and Waters.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR: acres:
- Wetlands MBR: acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters: 2290.32 linear feet, 7.49 width (ft)
- Other waters
- Wetlands

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

- Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.
- Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant

July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature  

State: AZ  
County/Parish/borough: Pinal County  
City: N/A

Center coordinates of site: Lat. 32.8482°N  
Long. -111.2599°W

Name of nearest waterbody:  
Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  
Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)
☐ Office (Desk) Determination. Date: 
☐ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters: Linear Feet Width (ft) and/or Acres
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1; otherwise, see Section III.B below.

1. TNW

   Identify TNW: ____________

   Summarize rationale supporting determination:

   [ ] Vegetation

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.01471
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   [ ] Tributary flows directly to TNW
   [ ] Tributary flows through 4 tributaries before entering TNW

   Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:

Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:

Project waters are aerial (straight) miles from tributary to RPW:

Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural

Explain:

Tributary properties with respect to top of bank (estimate):

Average Width (ft): 

Average Depth (ft): 

Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):

- [ ] Silts
- [ ] Sands
- [ ] Concrete
- [ ] Muck
- [ ] Gravel
- [ ] Substrate - Vegetation
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined

Characteristics: 

Subsurface Flow: No

Explain: 

Dye (or other) test performed:

Tributary Has (Check all that apply):

- [ ] Bed and Banks
- [ ] OHWM (check all the apply): OHWM Indicators:
  - [ ] Clear, natural line impressed on the bank
  - [ ] Changes in soil character
  - [ ] Shelving
  - [ ] Vegetation matted down, bent or absent
  - [ ] Leaf litter disturbed or washed away
  - [ ] Sediment deposition
  - [ ] Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation

- Vegetation type/percent cover. Explain: (Habitat for:
  - Federally Listed Species  Explain:
  - Fish/Spawn Areas  Explain:
  - Other environmentally-sensitive species  Explain:
  - Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

   Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

   This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- [ ] TNWs Linear Feet: __________ Width (ft): __________ TNW Acres __________
- [ ] Wetlands adjacent to TNWs: Acres: __________

2. RPWs that flow directly or indirectly into TNWs

- [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: __________
- [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: __________
  Provide estimates for jurisdictional waters in the review area (check all that apply):
  - [ ] Tributary waters Linear Feet: __________ Width (Ft): __________
  - [ ] Other non-wetland waters: Acres: __________

3. Non-RPWs that flow directly or indirectly into TNWs.

- [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
  Provide estimates of jurisdictional waters within the review area (check all that apply):
  Length (Linear Feet): __________ Width (feet): __________ Acres: __________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: __________
  - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: __________
  Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
  Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): _______ Acres: _______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: _______ width (ft): _______
☐ Other Non-wetland Waters MBR acres: _______
☐ Wetlands MBR acres: _______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters 892.11 linear feet, 4.35 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

**Additional Comments to Support JD:**
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 258  
State: AZ County/Parish/borough: Pinal City: N/A

Center coordinates of site:  
Lat. 32.8482°N Long. -111.2599°W

Name of nearest waterbody: 
Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  

Name of watershed or Hydrologic Unit Code (HUC): 15050100  

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request  
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)  
☐ Office (Desk) Determination. Date:  
☐ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION  
There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION  
There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):  
      ☐ TNWs (new)  
      ☐ Wetlands adjacent to TNWs  
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
      ☐ Non-RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
      ☐ Impoundments of jurisdictional waters  
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands
   b. Identify (estimate) size of waters of the U.S. in the review area  
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres  
      Wetlands Acres:
   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):  
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:  
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ______________________  □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.00346
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         □ Tributary flows directly to TNW
         ✅ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
Average Width (ft):
Average Depth (ft):
Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- [ ] Silts
- [ ] Sands
- [ ] Concrete
- [ ] Muck
- [ ] Pebbles
- [ ] Gravel
- [ ] Substrate - Vegetation
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Pool Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Estimate average number of flow events in review area/year: 2-5

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:

Subsurface Flow: No Explain:

☐ Dye (or other) test performed:

Tributary Has (Check all that apply):

☐ Bed and Banks

☐ OHWM (check all the apply): OHWM Indicators:
- Clear, natural line impressed on the bank
- Changes in soil character
- Shelving
- Vegetation matted down, bent or absent
- Leaf litter disturbed or washed away
- Sediment deposition
- Water staining
- Presence of litter and debris
- Destruction of terrestrial vegetation
- Presence of wrack line
- Sediment sorting
- Scour
- Multiple observed or predicted flow events
- Abrupt change in plant community

Other (list):

☐ Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by: □
- oil or scum line along shore objects □
- fine shell or debris deposits (foreshore) □
- physical markings/characteristics □
- tidal gauges □
- other □

- Mean High water Mark indicated by: □
- survey to available datum □
- physical markings □
- vegetation lines/changes in vegetation types □

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

Explain:

Identify Specific Pollutants, if known:

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian Corridor Characteristics:
- Wetland Fringe Characteristics:

Habitat for:

- Federally Listed Species Explain findings:
- Fish/Spawn Areas Explain findings:
- Other environmentally -sensitive species Explain findings:
- Aquatic/Wildlife diversity Explain:

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

(a) General Wetland Characteristics
   Properties:
   - Wetland Size (ac):
   - Wetland Type, Explain:
   - Wetland Quality, Explain:

   Project Wetlands Cross or Serve as State Boundaries, Explain:

(b) General Flow Relationship with Non-TNW:
   - Wetland Flow is: Explain:
   - Surface Flow is:
   - Characteristics:
   - Subsurface Flow: Explain Findings:

(c) Wetland Adjacency Determination with Non-TNW:
   - Wetland Directly Abutting Non-TNW
   - Wetland Not Directly Abutting Non-TNW
   - Discrete wetland hydrologic connection Explain:
   - Ecological connection Explain:
   - Separated by berm/barrier Explain:

(d) Proximity (Relationship) to TNW
   - Project Wetlands: River Miles from TNW:
   - Project Wetlands: Aerial Miles from TNW:
   - Flow is From:
   - Estimate approximate Location of Wetland within Floodplain:
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

☐ Riparian Buffer Characteristics (type, average width):

☐ Vegetation type/percent cover. Explain:

Habitat for:

☐ Federally Listed Species Explain:

☐ Fish/Spawn Areas Explain:

☐ Other environmentally-sensitive species Explain:

☐ Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- TNWs Linear Feet: ______ Width (ft): ______ TNW Acres ______
- Wetlands adjacent to TNWs: Acres: ______

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: ______
- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: ______
  Provide estimates for jurisdictional waters in the review area (check all that apply):
  - Tributary waters Linear Feet: ______ Width (Ft): ______
  - Other non-wetland waters: Acres: ______

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
  Provide estimates of jurisdictional waters within the review area (check all that apply):
  Length (Linear Feet): ______ Width (Feet): ______ Acres: ______

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: ______
  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: ______
  Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
  Provide acreage estimates for jurisdictional wetland in the review area: Acres: ______

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Feature ID: 258

U.S Army Corps of Engineers

- Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres): 

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): Acres:

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters 676.44 linear feet (ft), 3.92 width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

- Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.

      Non-Wetlands waters Linear Feet Width (ft) and/or Acres

      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):

      ✓ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: 
   Summarize rationale supporting determination:
   ☐ Vegetation

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.01633
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
      (a) Relationship with TNW
         ☐ Tributary flows directly to TNW
         ☑ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
Feature ID: 259

**U.S. Army Corps of Engineers**

Project waters are _______ river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are _______ aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW: Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely deterministic of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
• Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
• Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

<table>
<thead>
<tr>
<th>Feature ID: 259</th>
</tr>
</thead>
<tbody>
<tr>
<td>Acres: TNW Acres</td>
</tr>
<tr>
<td>Width: TNW Acres</td>
</tr>
<tr>

</tr>
<tr>
<td>Width (ft): TNW Acres</td>
</tr>
</tbody>
</table>

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: [ ]
- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: [ ]

Provide estimates for jurisdictional waters in the review area (check all that apply):

- Tributary waters Linear Feet: Width (Ft): [ ]
- Other non-wetland waters: Acres: [ ]

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C.

Provide estimates of jurisdictional waters within the review area (check all that apply):

| Length (Linear Feet): Width (feet): Acres: |

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: [ ]
  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: [ ]

Provide acreage estimates for jurisdictional wetland in the review area: Acres: [ ]

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetland in the review area: Acres: [ ]

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetland in the review area (in acres):

7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet):  
Acres:  

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams):  linear feet:  width (ft):  
☐ Other Non-wetland Waters MBR acres:  
☐ Wetlands MBR acres:  

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters  linear feet (ft),  width (ft)  
☐ Other waters acres  
☐ Wetlands acres  

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.

a. Indicate presence of water of U.S. in review area (Check all the apply):

☐ TNWs (new)  
☐ Wetlands adjacent to TNWs  
☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
☐ Non-RPWs that flow directly or indirectly into TNWs  
☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
☐ Impoundments of jurisdictional waters  
☐ Isolated (interstate or intrastate) waters, including isolated wetlands

b. Identify (estimate) size of waters of the U.S. in the review area

Non-Wetlands waters Linear Feet Width (ft) and/or Acres  
Wetlands Acres: 

2. Non-Regulated Waters/Wetlands (check if applicable):

☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatice resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW: ____________________________
   - Vegetation
   - Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   - Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) **General Area Conditions**
      - Watershed Size (sq mi): 49650
      - Drainage Area (sq mi): 0.02585
      - Average Annual Rainfall (in): 10
      - Average Annual Snowfall (in): 0
   (ii) **Physical Characteristics**
      (a) **Relationship with TNW**
         - Tributary flows directly to TNW [ ]
         - Tributary flows through 4 tributaries before entering TNW
      - Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

   Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

   This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

   □ TNWs  Linear Feet: __________ Width (ft): __________ TNW Acres __________

   □ Wetlands adjacent to TNWs: Acres: __________

2. RPWs that flow directly or indirectly into TNWs

   □ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: __________

   □ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: __________

   Provide estimates for jurisdictional waters in the review area (check all that apply):

   □ Tributary waters  Linear Feet: __________ Width (ft): __________

   □ Other non-wetland waters: Acres: __________

3. Non-RPWs that flow directly or indirectly into TNWs.

   □ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

   Provide estimates of jurisdictional waters within the review area (check all that apply):

   Length (Linear Feet): __________ Width (feet): __________ Acres: __________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

   □ Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

   □ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: __________

   □ Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: __________

   Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

   □ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

   Provide acreage estimates for jurisdictional wetland in the review area: Acres: __________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): ______ Acres: ______

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters ______

Explain finding of no Significant Nexus: See Section IIIC.2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: ______ width (ft): ______
☐ Other Non-wetland Waters MBR acres: ______
☐ Wetlands MBR acres: ______

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the "Significant Nexus" standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters 1100.40 linear feet (ft), 5.50 width (ft)
☐ Other waters acres
☐ Wetlands acres

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 260

- State: AZ  
- County/Parish/borough: Pinal County  
- City: N/A

- Center coordinates of site: Lat. 32.8482°N   Long. -111.2599°W

- Name of nearest waterbody: Gila River between Powers Butte and Gillespie Dam

- Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  
  Gila River between Powers Butte and Gillespie Dam

- Name of watershed or Hydrologic Unit Code (HUC): 15050100

- Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request

- Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

- Office (Desk) Determination. Date:  
- Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

- There are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

- Waters subject to the ebb and flow of the tide.

- Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

- There are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

  1. Waters of the U.S.

     a. Indicate presence of water of U.S. in review area (Check all the apply):

     - TNWs (new)
     - Wetlands adjacent to TNWs
     - Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
     - Non-RPWs that flow directly or indirectly into TNWs
     - Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
     - Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
     - Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
     - Impoundments of jurisdictional waters
     - Isolated (interstate or intrastate) waters, including isolated wetlands

     b. Identify (estimate) size of waters of the U.S. in the review area

     - Non-Wetlands waters: Linear Feet   Width (ft) and/or Acres
     - Wetlands Acres:  

     c. Limits (boundaries) of Jurisdiction based on:

  2. Non-Regulated Waters/Wetlands (check if applicable):

     - Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

     - Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1; otherwise, see Section III.B below.

1. **TNW**
   - Identify TNW:    
   - □ Vegetation
   - Summarize rationale supporting determination:

2. **Wetland adjacent to TNW**
   - Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e., tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   - (i) General Area Conditions:
     - Watershed Size (sq mi): 49650
     - Drainage Area (sq mi): 0.04921
     - Average Annual Rainfall (in): 10
     - Average Annual Snowfall (in): 0
   - (ii) Physical Characteristics:
     - □ Tributary flows directly to TNW
     - □ Tributary flows through 4 tributaries before entering TNW
     - Project waters are 30 (or more) river miles from TNW
**APPROVED JURISDICTIONAL DETERMINATION FORM**

**U.S. Army Corps of Engineers**

Project waters are river Miles from tributary to RPW:

Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:

Project waters are aerial (straight) miles from tributary to RPW:

Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

☐ Separated by berm/barrier Explain: ________________________________________________________________________________________

(d) Proximity (Relationship) to TNW

Project Wetlands: River Miles from TNW: __________________________________________

Project Wetlands: Aerial Miles from TNW: __________________________________________

Flow is From: _____________________________________________________________________

Estimate approximate Location of Wetland within Floodplain: ______________________________________________________________________
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain: 

Identify specific pollutants, if known:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian Buffer  Characteristics (type, average width):
- Vegetation  type/percent cover. Explain:

Habitat for:

- Federally Listed Species  Explain:
- Fish/Spawn Areas  Explain:
- Other environmentally-sensitive species  Explain:
- Aquatic/Wildlife Diversity  Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downstream flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

---

SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

   Identify TNW: ___________________________ □ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY ( THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:

   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.04136
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:

   (a) Relationship with TNW

   □ Tributary flows directly to TNW
   ✔ Tributary flows through 4 tributaries before entering TNW

   Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:  
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:  
Project waters are aerial (straight) miles from tributary to RPW:  
Project waters cross or serve as state boundaries. Explain:  
Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

### (b) General Tributary Characteristics

**Tributary is:** Natural  
Explain:  

Tributary properties with respect to top of bank (estimate):  
- **Average Width (ft):**  
- **Average Depth (ft):**  
- **Average Side Slopes:** 3:1  

Primary tributary substrate composition (check all that apply):  
- Silts  
- Sands  
- Concrete  
- Muck  
- Gravel  
- Substrate - Vegetation  
- Other, Explain:  

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.  
**Presence of Run/Riffle/Pool Complexes.** Explain: Not present.  
**Tributary Geometry:** Relatively Straight  
**Tributary Gradient (approximate average slope):** 1%

### (c) Flow

**Tributary Provides for:** Ephemeral Flow  
**Estimate average number of flow events in review area/year:** 2-5  
**Describe Flow Regime:** Ephemeral.  
**Other Information on Duration and Volume:**  

**Surface Flow is:** Discrete and Confined  
**Characteristics:**  

**Subsurface Flow:** No  
**Explain:**  

- **Dye (or other) test performed:**  

**Tributary Has (Check all that apply):**  
- Bed and Banks  
- **OHWM (check all the apply):** OHWM Indicators:  
  - Clear, natural line impressed on the bank  
  - Changes in soil character  
  - Shelving  
  - Vegetation matted down, bent or absent  
  - Leaf litter disturbed or washed away  
  - Sediment deposition  
  - Water staining  
  - Presence of litter and debris  
  - Destruction of terrestrial vegetation  
  - Presence of wrack line  
  - Sediment sorting  
  - Scour  
  - Multiple observed or predicted flow events  
  - Abrupt change in plant community  
- **Other (list):**  

- **Discontinuous?** Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):

- High tide line indicated by:
- Mean High water Mark indicated by:
- Oil or scum line along shore objects
- Fine shell or debris deposits (foreshore)
- Physical markings/characteristics
- Tidal gauges
- Other

(iii) Chemical Characteristics:

Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):

  - Other environmentally-sensitive species Explain:
  - Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

   All wetland(s) being considered in cumulative analysis:
   Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g., between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.
   Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

   This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage...
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:

- TNW Linear Feet: ___________ Width (ft): ___________ TNW Acres ___________
- Wetlands adjacent to TNWs: Acres: ___________

2. RPWs that flow directly or indirectly into TNWs

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial: ___________

- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: ___________

  Provide estimates for jurisdictional waters in the review area (check all that apply):

  - Tributary waters Linear Feet: ___________ Width (ft): ___________
  - Other non-wetland waters: Acres: ___________

3. Non-RPWs that flow directly or indirectly into TNWs.

- Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.

  Provide estimates of jurisdictional waters within the review area (check all that apply):

  Length (Linear Feet): ___________ Width (feet): ___________ Acres: ___________

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

  - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW: ___________

  - Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW: ___________

  Provide acreage estimates for jurisdictional wetland in the review area: Acres: ___________

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

  Provide acreage estimates for jurisdictional wetland in the review area: Acres: ___________

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): [ ] Acres: [ ]

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: [ ] width (ft): [ ]
☐ Other Non-wetland Waters MBR acres: [ ]
☐ Wetlands MBR acres: [ ]

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters 1285.08 linear feet (ft), 5.48 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)  
      ☐ Wetlands adjacent to TNWs  
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
      ☐ Non-RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
      ☐ Impoundments of jurisdictional waters  
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands
   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:
   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________________ □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
   Watershed Size (sq mi): 49650
   Drainage Area (sq mi): 0.00230
   Average Annual Rainfall (in): 10
   Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
   (a) Relationship with TNW
   □ Tributary flows directly to TNW
   ☑ Tributary flows through _______ tributaries before entering TNW
   Project waters are _______ (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics
Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
Average Width (ft):
Average Depth (ft):
Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Cobble
- Gravel
- Substrate - Vegetation
- Other, Explain:

Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain: Stable.
Presence of Run/Riffle/Pool Complexes. Explain: Not present.
Tributary Geometry: Relatively Straight
Tributary Gradient (approximate average slope): 1%

(c) Flow:
Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5
Describe Flow Regime: Ephemeral.

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - TNWs Linear Feet: Width (ft): TNW Acres
   - Wetlands adjacent to TNWs: Acres:

2. RPWs that flow directly or indirectly into TNWs
   - Tributaries of TNWs where tributaries typically flow year-round are jurisdicitional. Provide data and Rationale indicating that tributary is perennial:
   - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdicitional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdicitional waters in the review area (check all that apply):
       - Tributary waters Linear Feet: Width (Ft).
       - Other non-wetland waters: Acres:

3. Non-RPWs that flow directly or indirectly into TNWs.
   - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdicitional. Data supporting this conclusion provided at section III.c.
   - Provide estimates of jurisdicitional waters within the review area (check all that apply):
     - Length (Linear Feet): Width (feet): Acres:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - Wetlands directly abut RPW and thus are jurisdicitional as adjacent wetlands.
     - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
       - Provide acreage estimates for jurisdicitional wetland in the review area:

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdicitional. Data supporting this conclusion is provided at Section III.C.
   - Provide acreage estimates for jurisdicitional wetland in the review area:

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): [ ] Acres: [ ]

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non wetland-Waters (i.e., rivers, streams): linear feet: [ ] width (ft): [ ]
☐ Other Non-wetland Waters MBR acres: [ ]
☐ Wetlands MBR acres: [ ]

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☑ Non-wetland waters 534.31 linear feet (ft), 4.73 width (ft)
☐ Other waters acres
☐ Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☑ Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.
☑ Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant
☐ Office Concurs with data sheets/delineation report
☐ Office Does Not Concur with data sheets/delineation report

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 263

State: AZ  
County/Parish/borough: Pinal County  
City: N/A

Center coordinates of site: Lat. 32.8482°N Long. -111.2599°W

Name of nearest waterbody: 

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:
Gila River between Powers Butte and Gillespie Dam

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)

☐ Office (Desk) Determination. Date:  
☒ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION

There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.

☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION

There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)  
      ☐ Wetlands adjacent to TNWs  
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
      ☐ Non-RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
      ☐ Impoundments of jurisdictional waters  
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☒ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:

   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatice resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________________  □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
       Watershed Size (sq mi): 49650
       Drainage Area (sq mi): 0.01392
       Average Annual Rainfall (in): 10
       Average Annual Snowfall (in): 0
   (ii) Physical Characteristics:
       (a) Relationship with TNW
           □ Tributary flows directly to TNW
           ✔ Tributary flows through 4 tributaries before entering TNW
           Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW
Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics

Tributary is: Natural Explain:

Tributary properties with respect to top of bank (estimate):
- Average Width (ft):
- Average Depth (ft):
- Average Side Slopes: 3:1

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Cobbles
- Gravel
- Substrate - Vegetation
- Other, Explain:

Tributary Condition/ Stability [e.g., highly eroding, sloughing banks. Explain: Stable.

Presence of Run/Riffle/Poll Complexes. Explain: Not present.

Tributary Geometry: Relatively Straight

Tributary Gradient (approximate average slope): 1%

(c) Flow:

Tributary Provides for: Ephemeral Flow

Describe Flow Regime: Ephemeral.

Other Information on Duration and Volume:

Surface Flow is: Discrete and Confined Characteristics:

Subsurface Flow: No Explain:

Dye (or other) test performed:

Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
  - Presence of litter and debris
  - Destruction of terrestrial vegetation
  - Presence of wrack line
  - Sediment sorting
  - Scour
  - Multiple observed or predicted flow events
  - Abrupt change in plant community

Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):
- High tide line indicated by:
- Mean High water Mark indicated by:
- oil or scum line along shore objects
- fine shell or debris deposits (foreshore)
- physical markings/characteristics
- tidal gauges
- other

(iii) Chemical Characteristics:
Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):
Explain:
Identify Specific Pollutants, if known:

(iv) Biological Characteristics. Channel supports (check all that apply):
- Riparian Corridor Characteristics:
- Wetland Fringe Characteristics:
Habitat for:
- Federally Listed Species
- Fish/Spawn Areas
- Other environmentally-sensitive species
- Aquatic/Wildlife diversity

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:
(a) General Wetland Characteristics
Properties:
- Wetland Size (ac):
- Wetland Type, Explain:
- Wetland Quality, Explain:
Project Wetlands Cross or Serve as State Boundaries, Explain:

(b) General Flow Relationship with Non-TNW:
- Wetland Flow is:
- Surface Flow:
  - Characteristics:
- Subsurface Flow:
  - Explain Findings:

(c) Wetland Adjacency Determination with Non-TNW:
- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW
  - Discrete wetland hydrologic connection
  - Ecological connection
  - Separated by berm/barrier

(d) Proximity (Relationship) to TNW
- Project Wetlands: River Miles from TNW:
- Project Wetlands: Aerial Miles from TNW:
- Flow is From:
- Estimate approximate Location of Wetland within Floodplain:
(ii) Chemical Characteristics:
Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics: ect.).

Explain:

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- □ Riparian Buffer Characteristics (type, average width):
- □ Vegetation type/percent cover. Explain:

Habitat for:
- □ Federally Listed Species Explain:
- □ Fish/Spawn Areas Explain:
- □ Other environmentally-sensitive species Explain:
- □ Aquatic/Wildlife Diversity Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?; size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
   - [ ] TNWs Linear Feet: [ ] Width (ft): [ ] TNW Acres [ ]
   - [ ] Wetlands adjacent to TNWs: Acres: [ ]

2. RPWs that flow directly or indirectly into TNWs
   - [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:
   - [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
     - Provide estimates for jurisdictional waters in the review area (check all that apply):
       - [ ] Tributary waters Linear Feet: [ ] Width (ft): [ ]
       - [ ] Other non-wetland waters: Acres: [ ]

3. Non-RPWs that flow directly or indirectly into TNWs.
   - [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.c.
     - Provide estimates of jurisdictional waters within the review area (check all that apply):
       - Length (Linear Feet): [ ] Width (feet): [ ] Acres: [ ]

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   - [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:
     - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW
       - Provide acreage estimates for jurisdictional wetland in the review area: Acres: [ ]

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW
   - [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
     - Provide acreage estimates for jurisdictional wetland in the review area: Acres: [ ]

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:

Length (linear feet): __________ Acres: __________

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Explain finding of no Significant Nexus: See Section IIIC2.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: __________ width (ft): __________
- Other Non-wetland Waters MBR acres: __________
- Wetlands MBR acres: __________

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters 917.32 linear feet (ft), 4.92 width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

- Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.
- Data Sheets Prepared/Submitted by or on behalf of Applicant/Consultant

☐ Office (Desk) Determination. Date: 
☒ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS
A. RHA SECTION 10 DETERMINATION OF JURISDICTION
There ☐ Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area.
☐ Waters subject to the ebb and flow of the tide.
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION
There ☐ Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):
      ☐ TNWs (new)
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands
   
   b. Identify (estimate) size of waters of the U.S. in the review area
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:

2. Non-Regulated Waters/Wetlands (check if applicable):
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
   Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ___________________________ ☐ Vegetation

   Summarize rationale supporting determination:

2. Wetland adjacent to TNW

   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.12585
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
      (a) Relationship with TNW
         ☐ Tributary flows directly to TNW
         ✓ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
Project waters are river Miles from tributary to RPW:
Project waters are 30 (or more) aerial (straight) miles from tributary to TNW:
Project waters are aerial (straight) miles from tributary to RPW:
Project waters cross or serve as state boundaries. Explain:
Identify flow route to TNW Towards the Santa Cruz Flats through ephemeral tributaries, tributary to Picacho Reservoir, McClellan Wash, or ag fields. Discrete flow path is not often discernible past these points, but overall topography suggests flows would be towards the Gila River.

(b) General Tributary Characteristics
Tributary is: Natural Explain:
Tributary properties with respect to top of bank (estimate):
Average Width (ft):
Average Depth (ft):
Average Side Slopes: 3:1
Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Concrete
- Muck
- Cobble
- Gravel
- Substrate - Vegetation
Other, Explain:
Tributary Condition/Stability [e.g., highly eroding, sloughing banks. Explain]: Stable.
Presence of Run/Riffle/Pool Complexes. Explain: Not present.
Tributary Geometry: Relatively Straight
Tributary Gradient (approximate average slope): 1%

(c) Flow:
Tributary Provides for: Ephemeral Flow
Estimate average number of flow events in review area/year: 2-5
Describe Flow Regime: Ephemeral.
Other Information on Duration and Volume:
Surface Flow is: Discrete and Confined Characteristics:
Subsurface Flow: No Explain:
Dye (or other) test performed:
Tributary Has (Check all that apply):
- Bed and Banks
- OHWM (check all the apply): OHWM Indicators:
  - Clear, natural line impressed on the bank
  - Changes in soil character
  - Shelving
  - Vegetation matted down, bent or absent
  - Leaf litter disturbed or washed away
  - Sediment deposition
  - Water staining
Other (list):
Discontinuous? Explain:
If factors other than the OHWN were used to determine lateral extent of CWA jurisdiction (Check all that apply):
- High tide line indicated by: __________________________
- Mean High water Mark indicated by: __________________________
- oil or scum line along shore objects
- fine shell or debris deposits (foreshore)
- physical markings/characteristics
- tidal gauges
- other

(iii) Chemical Characteristics:
Characterize Tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc):
Explain: __________________________
Identify Specific Pollutants, if known: __________________________

(iv) Biological Characteristics. Channel supports (check all that apply):
- Riparian Corridor Characteristics: __________________________
- Wetland Fringe Characteristics: __________________________
Habitat for:
- Federally Listed Species Explain findings: __________________________
- Fish/Spawn Areas Explain findings: __________________________
- Other environmentally -sensitive species Explain findings: __________________________
- Aquatic/Wildlife diversity Explain: __________________________

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:
(a) General Wetland Characteristics
Properties:
- Wetland Size (ac): __________________________
- Wetland Type, Explain: __________________________
- Wetland Quality, Explain: __________________________
Project Wetlands Cross or Serve as State Boundaries, Explain: __________________________

(b) General Flow Relationship with Non-TNW:
Wetland Flow is: __________________________
Surface Flow is: __________________________
Characteristics: __________________________
Subsurface Flow: __________________________
Explain Findings: __________________________

(c) Wetland Adjacency Determination with Non-TNW:
- Wetland Directly Abutting Non-TNW
- Wetland Not Directly Abutting Non-TNW
- Discrete wetland hydrologic connection Explain: __________________________
- Ecological connection Explain: __________________________
- Separated by berm/barrier Explain: __________________________

(d) Proximity (Relationship) to TNW
Project Wetlands: River Miles from TNW: __________________________
Project Wetlands: Aerial Miles from TNW: __________________________
Flow is From: __________________________
Estimate approximate Location of Wetland within Floodplain: __________________________
(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics; etc.).

Explain

Identify specific pollutants, if know:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- □ Riparian Buffer Characteristics (type, average width):
- □ Vegetation type/percent cover. Explain:

Habitat for:

- □ Federally Listed Species Explain:
- □ Fish/Spawn Areas Explain:
- □ Other environmentally-sensitive species Explain:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in cumulative analysis:

Wetland acres in total being considered in cumulative analysis:

Describe each wetland (directly abuts tributary?, size in acres; overall biological, chemical or physical functions):

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW.

Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below.

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNW.

Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to section III.D:

This ephemeral drainage is located more than 80 river miles from the nearest TNW, the Gila River between Powers Butte and Gillespie Dam. An analysis of peak yearly discharges and potential flood discharges, in combination with the geomorphology of the Analysis Area, the ephemeral nature of intervening drainage reaches, the significant alteration of the potential path of downgradient flow, and the distance to the TNW, suggests that the possibility of a hydrologic connection between this drainage and the TNW is tenuous. No pollutants or critical habitats were identified within the Analysis Area. Additionally, this unnamed ephemeral drainage does not provide lifecycle support functions, nutrients, or organic carbon to species within the TNW. This drainage does not have more than a speculative or insubstantial effect on the physical, chemical, and/or biological integrity of the TNW. Therefore, this unnamed ephemeral drainage
does not possess a significant nexus with the designated downstream TNW, the Gila River between Powers Butte and Gillespie Dam.

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY)

1. TNWs and Adjacent Wetlands.  Check all that apply and provide size estimates in review area:

- [ ] TNWs  Linear Feet:  Width (ft):  TNW Acres  
- [ ] Wetlands adjacent to TNWs:  Acres:  

2. RPWs that flow directly or indirectly into TNWs

- [ ] Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and Rationale indicating that tributary is perennial:  
- [ ] Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:  
  
  Provide estimates for jurisdictional waters in the review area (check all that apply):

  - [ ] Tributary waters  Linear Feet:  Width (Ft).
  - [ ] Other non-wetland waters:  Acres:  

3. Non-RPWs that flow directly or indirectly into TNWs.

- [ ] Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has significant nexus with a TNW is jurisdictional. Data supporting this conclusion provided at section III.C. Provide estimates of jurisdictional waters within the review area (check all that apply):

  Length (Linear Feet):  Width (feet):  Acres:  

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

- [ ] Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
  - [ ] Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting and RPW:  
  - [ ] Wetlands directly abutting an RPW where tributaries typically flow "Seasonally". Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2 above. Provide rationale indicating that wetland is directly abutting and RPW:  
  
  Provide acreage estimates for jurisdictional wetland in the review area:  Acres:  

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNW

- [ ] Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
  
  Provide acreage estimates for jurisdictional wetland in the review area:  Acres:  

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
7. Impoundments of jurisdictional waters.

Demonstration of Jurisdiction:

E. ISOLATED WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE

Supporting rationale:
Length (linear feet): 
Acres: 

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS:

Non-Jurisdictional Waters

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non wetland-Waters (i.e., rivers, streams): linear feet: width (ft):
- Other Non-wetland Waters MBR acres:
- Wetlands MBR acres:

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

- Non-wetland waters linear feet (ft), width (ft)
- Other waters acres
- Wetlands acres

SECTION IV: DATA SOURCES

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

- Maps, Plans, Plots or Plat Submitted by Applicant/Consultant: WestLand Resources, Inc.

Additional Comments to Support JD:
This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD)  
July 5, 2013

B. DISTRICT OFFICE, FILE NAME, AND NUMBER  
Los Angeles District, File No. Pending

C. PROJECT LOCATION AND BACKGROUND INFORMATION: Drainage Feature 265  
State: AZ  
County/Parish/borough: Pinal County  
City: N/A  
Center coordinates of site: Lat. 32.8482°N Long. -111.2599°W

Name of nearest waterbody:  
Gila River between Powers Butte and Gillespie Dam

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows:  

Name of watershed or Hydrologic Unit Code (HUC): 15050100

☐ Check if map/diagram of review are and/or potential jurisdictional areas is/are available upon request  
☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY)  
☐ Office (Desk) Determination. Date:  
☐ Field Determination. Date(s): 10/2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION  
There Are No "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329 in the review area.

☐ Waters subject to the ebb and flow of the tide.  
☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION  
There Are No "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area.

1. Waters of the U.S.
   a. Indicate presence of water of U.S. in review area (Check all the apply):  
      ☐ TNWs (new)  
      ☐ Wetlands adjacent to TNWs  
      ☐ Relatively permanent waters (RPWs) that flow directly or indirectly into TNWs  
      ☐ Non-RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs  
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs  
      ☐ Impoundments of jurisdictional waters  
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands  

   b. Identify (estimate) size of waters of the U.S. in the review area  
      Non-Wetlands waters Linear Feet Width (ft) and/or Acres  
      Wetlands Acres:

   c. Limits (boundaries) of Jurisdiction based on:  

2. Non-Regulated Waters/Wetlands (check if applicable):  
   ☑ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional:
      Explain: Drainage is ephemeral and does not qualify as a TNW or RPW. Therefore, this drainage could only be considered jurisdictional if it possessed a significant nexus with a downstream TNW. This drainage does not possess a significant nexus with the downstream TNW.
SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1; only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1; otherwise, see Section III.B below.

1. TNW
   Identify TNW: ____________________________  □ Vegetation
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is "adjacent"

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY)

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under Rapanos have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW
   (i) General Area Conditions:
      Watershed Size (sq mi): 49650
      Drainage Area (sq mi): 0.00590
      Average Annual Rainfall (in): 10
      Average Annual Snowfall (in): 0

   (ii) Physical Characteristics:
      (a) Relationship with TNW
         □ Tributary flows directly to TNW
         ☑ Tributary flows through 4 tributaries before entering TNW
         Project waters are 30 (or more) river miles from TNW
**b) General Tributary Characteristics**
